PRODUCT MONOGRAPH

Pr. CEFAZOLIN FOR INJECTION

USP

Antibiotic

Teva Canada Limited
30 Novopharm Court
Toronto, Ontario
M1B 2K9

Date of Revision: April 12, 2013

Control No: 156893, 163977
ACTION AND CLINICAL PHARMACOLOGY

CEFAZOLIN is a cephalosporin antibiotic for parenteral administration. Cefazolin exerts its bactericidal effect by inhibiting bacterial cell wall synthesis. Cefazolin is about 85% bound to serum protein. The peak level in serum is approximately 32-42 mg/mL after an intramuscular (i.m.) injection of 500 mg. Over 80% of injected cefazolin is excreted in the urine during the first 24 hours after i.m. injection; most is excreted during the first 4-6 hours.

INDICATIONS AND CLINICAL USE

CEFAZOLIN FOR INJECTION is indicated in the treatment of the following infections when caused by susceptible strains of the listed organisms:

RESPIRATORY TRACT INFECTIONS caused by *Streptococcus pneumoniae*, *Klebsiella pneumoniae*, *Hemophilus influenzae*, *Staphylococcus aureus* (penicillin-sensitive and penicillin-resistant) and group A *beta-haemolytic streptococci*.

URINARY TRACT INFECTIONS caused by *Escherichia coli*, *Proteus mirabilis*, *Klebsiella pneumoniae* and some strains of enterobacter, and enterococci. See NOTE below.

SKIN AND SOFT TISSUE INFECTIONS caused by *Staphylococcus aureus* (penicillin-sensitive and penicillin-resistant), group A *beta-haemolytic streptococci* and other strains of streptococci.

BONE AND JOINT INFECTIONS caused by *Staphylococcus aureus*.

SEPTICEMIA caused by *Streptococcus pneumoniae*, *Staphylococcus aureus* (penicillin-sensitive and penicillin resistant), *Proteus Mirabilis*, *Escherichia coli* and *Klebsiella pneumoniae*. See NOTE below.
ENDOCARDITIS caused by *Staphylococcus aureus* (penicillin-sensitive and penicillin-resistant) and group A *beta haemolytic streptococci*.

Determine susceptibility of the causative organism to cefazolin sodium, by performing appropriate culture and susceptibility studies should be performed. (See MICROBIOLOGY for disc susceptibility tests and dilution techniques).

**NOTE:** Most strains of *Enterococci*, indole positive *Proteus* (P. vulgaris), *Enterobacter cloacae*, *Morganella morganii*, *Providencia rettgeri* and methicillin-resistant *Staphylococci* are resistant. *Serratia, Pseudomonas*, and *Acinetobacter calcoaceticus* (formerly *Mima* and *Herellea* species) are almost uniformly resistant to cefazolin. (See MICROBIOLOGY).

Perioperative Prophylaxis: In patients undergoing potentially contaminated surgical procedures, and in patients in whom infection would pose a serious risk (e.g., during open-heart surgery and prosthetic arthroplasty), the preoperative, intraoperative and postoperative administration of CEFAZOLIN FOR INJECTION may reduce the incidence of certain post-operative infections.

Identification of the causative organisms should be made by culture should signs of infection occur, so that appropriate therapy may be instituted.

**CONTRAINDICATIONS**

CEFAZOLIN FOR INJECTION is contraindicated in patients with known allergy to the cephalosporin group of antibiotics.

**WARNINGS**

CEFAZOLIN FOR INJECTION should be used with caution in penicillin-allergic patients. There is clinical evidence of partial cross-allergenicity of the penicillins and the cephalosporins. There are instances of patients who have had reactions to both penicillins and cephalosporins (including fatal anaphylaxis after parenteral use). Clinical and laboratory evidence of partial cross-allergenicity of the two drug classes exists.

CEFAZOLIN SODIUM should be administered cautiously and then only when absolutely necessary to any patient who has demonstrated allergy, particularly to drugs. Immediate emergency treatment with epinephrine is indicated for serious anaphylactoid reactions. As indicated, oxygen, intravenous steroids, and airway management, including intubation, should also be employed. There have been reports of pseudo membranous colitis with the use of cephalosporins. It is therefore important to consider its diagnosis in patients who develop diarrhea in association with antibiotic use.
PRECAUTIONS

The overgrowth of non-susceptible organisms may result from the prolonged use of CEFAZOLIN FOR INJECTION. It is essential that the patient be carefully observed. In patients with a history of lower gastrointestinal disease, particularly colitis, cefazolin sodium should be prescribed with caution. ClinitestR tablets solution, but not enzyme-based tests such as ClinistixR and Tes-TapeR, may falsely indicate glucose in the urine of patients on cefazolin. Positive direct and indirect Coombs’ tests have been reported during treatment with cefazolin. These may also occur in neonates whose mothers received cephalosporins before delivery. The clinical significance of this effect has not been established.

Use In Renal Impairment:
Caution should be exercised in treating patients with pre-existing renal damage although cefazolin has not shown evidence of nephrotoxicity. Patients with low urinary output due to impaired renal function should be administered reduced daily dosages of cefazolin. (See Dosage in Patients with Reduced Renal Function.) Blood levels of cefazolin in dialysis patients remain fairly high and should be monitored. Probenecid may decrease renal tubular secretion of cefazolin when used concurrently with Cefazolin Sodium, resulting in increased and prolonged cefazolin blood levels.
In beta-haemolytic streptococcal infections, treatment should be continued for at least 10 days, to minimize possible complications associated with the disease.

Use in Pregnancy and Lactation:
The safety of the use of cefazolin sodium during pregnancy has not been established.

Lactation:
Very low concentrations of cefazolin are found in the milk of nursing mothers. Cefazolin sodium should be administered with caution to a nursing woman.
Children:
The safety of the use of cefazolin sodium in prematures and infants under one month of age has not been established.

Drug Interactions:
The renal tubular secretion of cefazolin may be decreased when probenecid is used concurrently, resulting in increased and prolonged cefazolin blood levels.

ADVERSE REACTIONS

The following reactions have been reported:

Gastrointestinal: Diarrhea, oral candidiasis (oral thrush), vomiting, nausea, stomach cramps, anorexia. During antibiotic treatment symptoms of pseudo membranous colitis can appear. There have been rare reports of nausea and vomiting.

Allergic: Allergic reactions occur infrequently and include: anaphylaxis, eosinophilia, itching, drug fever, skin rash.

Haematologic: Neutropenia, anemia, leukopenia, thrombocythemia, positive direct and indirect antiglobulin (Coombs’) tests.

Hepatic and Renal: Without clinical evidence of renal or hepatic impairment transient increases in AST (SGOT), ALT (SGPT), BUN and alkaline phosphatase levels have been observed. Transient hepatitis and cholestatic jaundice have been reported rarely, as with some penicillins and some other cephalosporins.

Local Reactions: Phlebitis at the site of injection has occurred rarely. Infrequently there is pain at the site of injection following intramuscular injection. Some induration has been reported.

Other Reactions: Vulvar pruritus, genital moniliasis, vaginitis and anal pruritus.

SYMPTOMS AND TREATMENT OF OVERDOSEAGE

For management of a suspected drug overdose, contact your regional Poison Control Centre.

There is a lack of experience with acute CEFAZOLIN FOR INJECTION overdosage. Supportive therapy should be instituted according to symptoms in cases of suspected overdosage.
DOSAGE AND ADMINISTRATION

DOSAGE
After reconstitution CEFAZOLIN FOR INJECTION may be administered either intramuscularly or intravenously. In both cases total daily dosages are the same.

ADULTS:

**Adult Dosage Guide**

</tbody>
</table>

*This dosage recommendation applies to intramuscular use. The efficacy of cefazolin sodium when administered intravenously at 12-hour intervals has not been established.

Cefazolin sodium has been administered in dosages of 6 g per day in serious infections such as endocarditis.

Treatment should be continued for at least 10 days in beta-haemolytic streptococcal infections to minimize possible complications associated with the disease.

**Dosage in Patients with Reduced Renal Function:**
After an initial loading dose appropriate to the severity of the infection, the following reduced dosage schedule is recommended:

**Dosage Guide for Patients with Renal Impairment**

<td>125 mg to 500 mg every 18 hours</td>
</tr>
</tbody>
</table>

**Perioperative Prophylactic Use:**
The recommended dosage regimen to prevent postoperative infection in contaminated or potentially contaminated surgery is:

- One gram intravenously or intramuscularly administered ½ hour to 1 hour prior to the start of surgery so that at the time of the initial surgical incision adequate antibiotic levels are present in the serum and tissues.
b. For lengthy operative procedures (e.g., 2 hours or more) 0.5-1.0 g administered intravenously or intramuscularly during surgery. (Administration should be modified according to the duration of the operative procedure and the time of greatest exposure to infective organisms.)
c. Postoperatively, 0.5-1.0 gram intravenously or intramuscularly every 6 to 8 hours for 24 hours postoperatively. The prophylactic administration of cefazolin sodium maybe continued for 3 to 5 days following the completion of surgery in which the occurrence of infection may be particularly devastating (e.g., open-heart surgery and prosthetic arthroplasty).

**CHILDREN:**
A total daily dosage of 25 to 50 mg per kg (approximately 10 to 20 mg per pound) of body weight, divided into three or four equal doses, is effective for most mild to moderately severe infections in children.

For severe infections total daily dosage maybe increased to 100 mg per kg (45 mg per pound) of body weight. The use of cefazolin in prematures and in infants under one month is not recommended since the safety for use in these patients has not been established.

* 225 mg/mL concentration may be obtained by reconstituted the 500 mg vial with 2.0 mL of diluent.

Treatment with 60 percent of the normal daily dose may be administered in divided doses every 12 hours to children with mild to moderate renal impairment (Ccr 0.67-1.17 mL/s). Children with moderate to severe renal impairment (Ccr 0.33-0.87 mL/s) should be given 25 percent of the normal daily dose in equally divided doses every 12 hours, and children with severe renal impairment (Ccr 0.08-0.33 mL/s) should receive 10 percent of the normal daily dose every 24 hours.

All dosage recommendations apply after an initial loading dose.

ADMINISTRATION

NOTE: See PHARMACEUTICAL INFORMATION for reconstitution and dilution directions.

Intramuscular Administration:
Inject the reconstituted solution into a large muscle mass, Pain on injection of cefazolin sodium occurs infrequently.

Intravenous Administration:
Direct (bolus) injection: Inject the appropriately diluted reconstituted solution slowly over 3 to 5 minutes directly into a vein or through tubing for patients receiving parenteral fluids. (See list of solutions for intravenous infusion in PHARMACEUTICAL INFORMATION.)
Intermittent or Continuous Infusion: The reconstituted solution can be administered along with primary intravenous fluid management programs in a volume control set or in a separate secondary i.v. bottle. (See list of solutions for intravenous infusion in PHARMACEUTICAL INFORMATION.)
PHARMACEUTICAL INFORMATION

Drug Substance:
Proper Name: cefazolin sodium
Chemical Name: Monosodium (6R, 7R)-3{[(5-methyl-1,,3,4-thiadiazol-2-yl)thio]methyl}-8-oxo-7-[2-(1H-tetrazol-1-yl)acetamido]-5 -thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate.

Molecular Formula: C_{14}H_{13}N_{8}NaO_{4}S_{3}
Molecular Weight: 476.5

Description: Cefazolin sodium is a white to off-white, practically odourless, solid. The drug is freely soluble in water and very slightly soluble in alcohol. It is practically insoluble in chloroform and ether. The pH is between 4.5 and 6.0, in an aqueous solution containing 100 mg of cefazolin per millilitre.

Composition
Each vial contains cefazolin sodium. Each gram of cefazolin sodium contains 48 mg of sodium. CEFAZOLIN FOR INJECTION does not contain any preservative.

Stability and Storage Recommendations
CEFAZOLIN FOR INJECTION should be stored between 15° - 30°C, protected from light.

Reconstituted Solutions
Parenteral drug products should be SHAKEN WELL when reconstituted, and inspected visually for particulate matter prior to administration. The drug solutions should be discarded if particulate matter is evident in reconstituted fluids.
Reconstituted solutions may range in colour from pale yellow to yellow without a change in potency.
Reconstituted CEFAZOLIN FOR INJECTION may be stored for 24 hours at controlled room temperature not exceeding 25°C, or for 72 hours under refrigeration (2 to 8°C), protected from light.
CEFAZOLIN FOR INJECTION solution reconstituted with bacteriostatic diluent and used for intramuscular administration as multiple-dose containers should be used within 7 days when stored under refrigeration.
The Pharmacy Bulk Vial is intended for multiple dispensing for intravenous use only, employing a single puncture. Following reconstitution, the solution should be dispensed and diluted for use within eight hours. Any unused reconstituted solution should be discarded after eight hours.
(1) For Intramuscular Injection:

Single Dose Vials:
Reconstitute according to the table which follows. SHAKE WELL.

**Single Dose Vial Reconstitution Table**

<table>
<thead>
<tr>
<th>Strength</th>
<th>Diluent</th>
<th>Volume to be Added to Vial (mL)</th>
<th>Approximate Available Volume (mL)</th>
<th>Nominal Concentration (mg/mL)</th>

<td>3</td>
<td>334</td>
</tr>
</tbody>
</table>

(2) For Direct Intravenous (bolus) Injection:

**Single Dose Vial:**
Reconstitute as directed above. SHAKE WELL. A minimum of 10 mL of Sterile Water for Injection should be used to dilute the reconstituted solution.

**Pharmacy Bulk Vial:**
Pharmacy Bulk Vials should be used for intravenous use only. Add, according to the table below, Sterile Water for Injection or Sodium Chloride Injection. SHAKE WELL.

**Pharmacy Bulk Vial Reconstitution Table**

<table>
<thead>
<tr>
<th>Strength</th>
<th>Amount of Diluent</th>

<td>92 mL*</td>
<td>104 mL</td>
<td>200 mg/mL</td>
</tr>
</tbody>
</table>

*Shake to dissolve and let stand until clear

The vial is intended for single puncture and multiple dispensing, and the vial contents should be used within 8 hours.
(3) For intermittent or continuous intravenous infusion, reconstituted CEFAZOLIN FOR INJECTION may be further diluted as follows:

**Single Dose Vials:**
Reconstitute according to the Single Dose Vial Reconstitution Table above. SHAKE WELL. Further dilute the reconstituted cefazolin sodium to 50 to 100 mL in one of the following solutions:
- Sodium Chloride Injection 0.9%
- Dextrose Injection 5% or 10%
- Dextrose 5% in Lactated Ringer’s Injection
- Dextrose 5% and Sodium Chloride Injection 0.9% (also may be used with Dextrose 5% and Sodium Chloride Injection 0.45% or 0.2%)
- Lactated Ringer’s Injection
- Ringer’s Injection
- Sodium Bicarbonate 5% in Sterile Water for Injection

**Pharmacy Bulk Vial:**
Reconstitute according to the Pharmacy Bulk Vial Reconstitution Table. SHAKE WELL. Further dilute aliquots in 50 to 100 mL of Sterile Water for Injection or one of the solutions listed above.
The further diluted solutions above should be used within 24 hours at room temperature or 72 hours under refrigeration from the time of initial puncture.

**AVAILABILITY OF DOSAGE FORMS**

CEFAZOLIN FOR INJECTION is supplied as a powder in clear glass vials equivalent to 500 mg or 1.0 g of cefazolin. CEFAZOLIN FOR INJECTION is also available as a Pharmacy Bulk Vial in vials equivalent to 10.0 g or 20.0 g of cefazolin.

THE AVAILABILITY OF THE PHARMACY BULK VIAL IS INTENDED FOR HOSPITALS WITH A RECOGNIZED IV ADMIXTURE PROGRAM.

* Reported as 3.13-6.25 µg/mL
+ Reported as ≤ 0.1 µg/mL

**Disc Susceptibility Tests**

The following criteria should be used to interpret tests using a standardized 30 µg cephalosporin-class disc:
- Zones of 18 mm or greater indicate that the tested organisms are susceptible and are likely to respond to therapy.
- Zones of 15 to 17 mm indicate organisms of intermediate susceptibility which may be susceptible if high dosage is used or if the infection is confined to tissues and fluids (e.g., urine) in which high antibiotic levels are attained.
- Zones of 14 mm or less are produced by resistant organisms.
- The cephalothin disc should not be used for testing susceptibility to other cephalosporins.

**Dilution Techniques:** If the minimal inhibitory concentration (MIC) for cefazolin is not more than 16 mg/mL, then a bacterial isolate may be considered susceptible. If the MIC is equal to or greater than 64 mg/mL, organisms are considered to be resistant.

The ranges of MIC for the control strains were:
- *E. coli* ATCC 25922 1.0-4.0 mg/mL
- *S. aureus* ATCC 25923 0.25-1.0 mg/mL
Clinical Pharmacology
The blood levels of cefazolin listed on the following tables were determined following intramuscular and intravenous administration.

</table>

The serum half-life is approximately 1.8 hours following intravenous administration and 2.0 hours after intramuscular administration.
The mean peak serum levels of cefazolin in hospitalized patients are approximately equivalent to those seen in normal volunteers.
Healthy volunteers received a continuous intravenous infusion of 3.5 mg/kg for 1 hour (approximately 250 mg) and 1.5 mg/kg hourly for the next two hours (approximately 100 mg). A steady serum level of 28 mg/mL was attained at the third hour.
Cefazolin levels in synovial fluid and serum are similar four hours after drug administration. Levels in cord blood are equivalent to 40% of those found in maternal blood.
In patients without obstructive biliary disease, serum levels of cefazolin can be up to five times lower than bile levels of cefazolin. However, bile levels of cefazolin are considerably lower than serum levels in patients with obstructive biliary disease.
Cefazolin is excreted unchanged in the urine. Approximately 60% of the drug is excreted in the first six hours, and this increases to 70%-80% within 24 hours. Peak urine concentrations of approximately 2400 mcg/mL and 4000 mcg/mL are achieved following intramuscular doses of 500 mg and 1 gram, respectively.
TOXICOLOGY

Acute Toxicity
Parenteral and oral cefazolin demonstrated low toxicity in rodents, canines and rabbits tested in acute toxicity studies.

Subacute and Chronic Toxicity
Rats and dogs were studied in subacute and chronic parenteral toxicity of cefazolin. Rats were treated for 3 and 6 months subcutaneously and for one month intraperitoneally. The highest doses ranged from 2000 mg/kg per day in the 6 month study to 4000 mg/kg per day in the 1 and 3 month studies. Anemia was the only significant abnormality attributable to s.c. drug administration. In all experiments there was a definite dose-related depression of SGPT levels. Leukocytosis and hypererythropoiesis accompanied the anemia, which was probably related to hemorrhaging at the injection site.

The lowering of the SGPT was dependent upon both the dose and the duration of treatment. This was not statistically significant at the low doses and was reversible upon withdrawal of the drug. Equivalent chronic studies in dogs produced similar results: at the higher doses there was a fall in SGPT and frank anemia resulted from high subcutaneous doses. Dogs treated intravenously did not develop the anemia indicating that it was probably associated with hemorrhaging at the site of injection.
**Reproduction and Teratology**
Rabbits and mice were administered cefazolin in doses of 240 mg/kg/day and 2400 mg/kg/day. No teratologic effects were observed. No adverse effects on mating, fertility, gestation, delivery and lactation were observed in rats administered 2000 mg/kg per day. Baby rats whose mothers were injected with 1200 mg/kg/day of cefazolin prior to delivery and throughout lactation were observed and there was no effect on the birth, or peri- and postnatal development.

**Nephrotoxicity**
The nephrotoxicity of cefazolin was studied following intravenous injections of rabbits and subcutaneous injections of mice and rats. The mean nephrotoxic intravenous dose in rabbits was between 300 and 400 mg/kg/day. No evidence of renal damage was produced when cefazolin was injected subcutaneously into mice at a dose of 8 g/kg/day for up to 3 days and into rats at a dose of 4 g/kg/day for up to 7 days.

REPORTING SUSPECTED SIDE EFFECTS

You can report any suspected adverse reactions associated with the use of health products to the Canada Vigilance Program by one of the following 3 ways:

- Report online at www.healthcanada.gc.ca/medeffect
- Call toll-free at 1-866-234-2345
- Complete a Canada Vigilance Reporting Form and:
  - Fax toll-free to 1-866-678-6789, or
  - Mail to: Canada Vigilance Program
    Health Canada
    Postal Locator 0701E
    Ottawa, ON K1A 0K9

Postage paid labels, Canada Vigilance Reporting Form and the adverse reaction reporting guidelines are available on the MedEffect™ Canada Web site at www.healthcanada.gc.ca/medeffect.

NOTE: Should you require information related to the management of side effects, contact your health professional. The Canada Vigilance Program does not provide medical advice.
