PRODUCT MONOGRAPH

VOLTAREN EMULGEL JOINT PAIN REGULAR STRENGTH

Diclofenac diethylamine Gel, 11.6 mg/g (1.16% w/w)

Non-Steroidal Anti-inflammatory Drug (NSAID)
Analgesic agent for topical use

GlaxoSmithKline Consumer Healthcare Inc.

INDICATIONS AND CLINICAL USE

Adults and adolescents aged 16 years and over:

VOLTAREN EMULGEL Joint Pain Regular Strength (diclofenac diethylamine gel) is indicated for:

- Relief of aches and pain associated with recent (acute), localized joint or muscle injuries such as sprains, strains or sports injuries (e.g. sore ankles, knees, hands or shoulder). This is typically as an adjunct to other measures such as rest for the relief of discomfort associated with such injuries.

Geriatrics (> 65 years of age):
The usual adult dosage may be used.

Paediatrics (< 16 years of age):
Not for use in children under 16 years of age.

CONTRAINDICATIONS

- Patients who are hypersensitive to this drug or to any ingredient in the formulation or component of the container. For a complete listing, see the Dosage Forms, Composition and Packaging section of the product monograph.
- Hypersensitivity to diclofenac, acetylsalicylic acid or other non-steroidal anti-inflammatory drugs.
- Patients with or without chronic asthma in whom attacks of asthma, urticaria or acute rhinitis are precipitated by acetylsalicylic acid or other non-steroidal anti-inflammatory agents.
Concomitant use of other products containing diclofenac.
Concomitant use of oral non-steroidal anti-inflammatory drugs (NSAIDs).
During the last trimester of pregnancy

WARNINGS AND PRECAUTIONS

General
VOLTAREN EMULGEL Joint Pain Regular Strength is for topical use only and should be applied only to intact, non-diseased skin and not to skin wounds or open injuries. It should not be used with occlusion. It should not be allowed to come into contact with the eyes or mucous membranes, and should never be taken by mouth.

VOLTAREN EMULGEL Joint Pain Regular Strength contains propylene glycol and benzyl benzoate, which may cause mild, localized skin irritation in some people.

Discontinue the treatment if a skin rash develops after applying the product.

VOLTAREN EMULGEL can be used with non-occlusive bandages but should not be used with an airtight occlusive dressing.

Systemic availability of diclofenac diethylamine through percutaneous absorption is low compared with plasma levels obtained following oral forms of diclofenac. Nevertheless, the possibility of systemic side effects cannot be completely excluded. Chances of this may be increased where VOLTAREN EMULGEL Joint Pain Regular Strength is applied to a relatively large area of skin and/or over an extended period of time (e.g., especially if this goes beyond the maximum duration recommended for use).

Some possibility of gastro-intestinal bleeding in patients with a significant history of peptic ulceration has been reported in isolated cases. VOLTAREN EMULGEL Joint Pain Regular Strength should therefore be used with caution by patients under medication for active peptic ulcers in the stomach or duodenum (e.g., proton pump inhibitors or histamine H2 receptor antagonists). If the patient is uncertain, they should be advised to consult their doctor or pharmacist.

Like other drugs that inhibit prostaglandin synthetase activity, diclofenac and other NSAIDs can precipitate bronchospasm if administered to patients suffering from or with a previous history of bronchial asthma.

Asthma has been rarely reported in patients using topical NSAID preparations.

Local irritation, erythema, pruritus or dermatitis may occasionally occur with topical diclofenac diethylamine. Skin photosensitivity, desquamation, discoloration and bullous or vesicular eruptions have been reported in isolated cases. Patients should be warned against excessive exposure to sunlight in order to reduce the incidence of photosensitivity.

The following additional side effects have been observed with oral forms of diclofenac sodium.
**Cardiovascular**
Isolated cases: palpitation, chest pain, hypertension.

**Gastrointestinal**
Occasional: Epigastric pain, other gastro-intestinal disorders (e.g. nausea, vomiting, diarrhoea, abdominal cramps, dyspepsia, flatulence, anorexia).
Rare: Gastro-intestinal bleeding, peptic ulcer (with or without bleeding or perforation), bloody diarrhoea.
In isolated cases: Lower gut disorders (e.g. non-specific haemorrhagic colitis and exacerbations of ulcerative colitis or Crohn's proctocolitis, colonic damage and stricture formation), pancreatitis, aphthous stomatitis, glossitis, oesophageal lesions, constipation.

**Haematologic**
In isolated cases: Thrombocytopenia, leucopenia, agranulocytosis, haemolytic anaemia, aplastic anaemia.

**Hepatic/Biliary/Pancreatic**
Occasional: Elevation of serum aminotransferase enzymes (ALT, AST).
Rare: Liver function disorders including hepatitis (in isolated cases fulminant) with or without jaundice.

**Immune**
Hypersensitivity reactions have been reported following treatment with NSAIDs. These may consist of rare cases of anaphylactic/anaphylactoid systemic reactions including hypotension, and respiratory tract reactivity comprising asthma, aggravated asthma, bronchospasm or dyspnoea. (See also “Skin”).

**Neurologic**
Occasional: Headache, dizziness, or vertigo.
Rare: Drowsiness, tiredness.
In isolated cases: Disturbances of sensation, paraesthesia, memory disturbance, disorientation, disturbance of vision (blurred vision, diplopia), impaired hearing. Tinnitus, insomnia, irritability, convulsions, depression, anxiety, nightmares, tremor, psychotic reactions. Taste alteration disorders.

**Renal**
In isolated cases: Acute renal failure, urinary abnormalities (e.g. haematuria, proteinuria), interstitial nephritis, nephrotic syndrome, papillary necrosis.

**Sexual Function/Reproduction**
Isolated cases: Impotence (association with diclofenac is doubtful).

**Skin**
Occasional: Rashes or skin eruptions.
Rare: Urticaria.
In isolated cases: Eczema, erythema multiforme, Stevens-Johnson syndrome, Lyell's syndrome, (acute toxic epidermolysis), photosensitivity reactions, erythroderma (exfoliative dermatitis), loss of hair, purpura including allergic purpura.

**Information concerning non medicinal ingredients**
VOLTAREN EMULGEL Joint Pain Regular Strength contains propylene glycol and benzyl benzoate, which may cause mild, localised skin irritation in some people.

**Special Populations**

**Pregnant Women:**
Since no experience has been acquired with diclofenac diethylamine gel in pregnancy, it is not recommended for use in these circumstances.

It is contraindicated during the last trimester of pregnancy, owing to the possibility of uterine inertia, fetal renal impairment with subsequent oligohydramnios and/or premature closure of the ductus arteriosus.

Animal data has shown an increased incidence of dystonia and delayed parturition when drug administration is continued into late pregnancy.

**Nursing Women:**
Since no experience has been acquired with diclofenac diethylamine gel in lactation, it is not recommended for use in these circumstances.

Following oral doses of 50 mg diclofenac administered every 8 hours, diclofenac passes into breast milk in quantities so small that no undesirable effects on the infant are to be expected.

**Geriatrics (> 65 years of age):** No specific hazards are associated with geriatric use of diclofenac diethylamine gel.

**Paediatrics (< 16 years of age):** Not for use in children under 16 years of age.

**Monitoring and Laboratory Tests**
No monitoring parameters or laboratory tests are required to monitor response to therapy or possible adverse reactions.

**ADVERSE REACTIONS**

**Adverse Drug Reaction Overview**

The adverse event incidence in the clinical studies was very low. The benign safety profile documented in the clinical studies is confirmed in the post-marketing experience in millions of patients worldwide. The adverse events occurring in studies were usually either moderate or
mild. Serious adverse events observed in all the studies, conducted over more than a decade, were very few in number and all unrelated to study treatment.

In post-marketing surveillance, approximately 90% of case reports are non-serious. Cutaneous adverse events, occurring mostly at the application site, constitute the most common symptoms reported. Serious adverse events associated with oral forms of diclofenac, including gastrointestinal bleeding, have been reported occasionally. No causal relationship has been established between diclofenac diethylamine gel and these systemic adverse events.

**Clinical Trial Adverse Drug Reactions**

*Because clinical trials are conducted under very specific conditions the adverse reaction rates observed in the clinical trials may not reflect the rates observed in practice and should not be compared to the rates in the clinical trials of another drug. Adverse drug reaction information from clinical trials is useful for identifying drug-related adverse events and for approximating rates.*

The clinical data set includes data obtained in approximately 4926 patients with either the target indication of soft-tissue injuries (e.g. sprains, strains, bruises), osteoarthritis or soft-tissue rheumatism, 2728 of whom received VOLTAREN EMULGEL Joint Pain Regular Strength, 1267 of whom received an active comparator, and 931 of whom received placebo. Patients were treated from 3-28 days as befitted the nature of the conditions under study.

Data from the safety population with the target indication investigated, who received short term exposure to VOLTAREN EMULGEL Joint Pain Regular Strength in controlled trials and uncontrolled trials, confirm that a dose of 2-4 g of VOLTAREN EMULGEL Joint Pain Regular Strength applied topically 3-4 times a day is safe and that the systemic adverse event profile observed for systemic NSAIDs is not seen with the topical formulation.

No subgroup analyses were performed. Long-term safety data from patients was not obtained in these studies as this is not relevant to a product intended for only short-term use up to 1 week. The safety of VOLTAREN EMULGEL Joint Pain Regular Strength was demonstrated in the safety population in clinical trials, which all showed that the incidence and type of rare or serious events resembles those of active controls or placebo.

The adverse events (AEs) whether or not drug related reported in 33 clinical trials are summarized in Table 1 (WHO-ART coding).
Similar percentages of local skin reactions including mostly itching, burning, erythema, local allergy and blistering were reported after both VOLTAREN EMULGEL Joint Pain Regular Strength (3.4%) and placebo (5.5%). Most of the local AEs were mild to moderate. There were no reports of photosensitivity, although one case report referred to exposure to the sun. Approximately 0.3% of patients were withdrawn due to local skin AEs after applying VOLTAREN EMULGEL Joint Pain Regular Strength or placebo.

In conclusion, the absolute numbers of reported adverse events were relatively small and there are no clinically significant differences in the incidence of adverse events in the VOLTAREN EMULGEL Joint Pain Regular Strength, placebo and reference drug treatment groups. Most of the AEs are local, mild to moderate and reversible.

**Less Common Clinical Trial Adverse Drug Reactions (<1%)**

**WHO-ART-coded clinical trials**

Digestive: Dyspepsia was observed in 0.58, 0.32, and 0.18% of VOLTAREN EMULGEL Joint Pain Regular Strength, Placebo, and Reference groups, respectively.

Body as a whole: Allergic events were observed in 0.04, 0.16, and 0.09% of VOLTAREN EMULGEL Joint Pain Regular Strength, Placebo, and Reference groups, respectively.

CNS: CNS events were observed in 0.09, 0.32, and 0.45% of VOLTAREN EMULGEL Joint Pain Regular Strength, Placebo, and Reference groups, respectively.

**Abnormal Hematologic and Clinical Chemistry Findings**

Clinical laboratory evaluations were not routinely performed in the studies undertaken for the indication of muscle and joint soft tissue injuries. The treatments were given for short periods only.

**Post-Market Adverse Drug Reactions**

**Tabulated list of adverse reactions**

The table includes adverse reactions from the clinical trials as well as from the post-marketing experience where causal relationship has been established.
Adverse reactions are listed below, by system organ class and frequency. Frequencies are defined as: very common (≥ 1/10); common (≥ 1/100 to < 1/10); uncommon (≥ 1/1,000 to < 1/100); rare (≥ 1/10,000 to < 1/1,000); very rare (< 1/10,000). Within each frequency grouping, undesirable effects are presented in order of decreasing seriousness.

**Infections and infestations**

Very rare: Rash pustular

**Immune system disorders**

Very rare: Hypersensitivity (including urticaria), angioedema

**Respiratory, thoracic and mediastinal disorders**

Very rare: Asthma

**Skin and subcutaneous tissue disorders**

Common: Dermatitis (including contact dermatitis), rash, erythema, eczema, pruritus.

Rare: Dermatitis bullous.

Very rare: Photosensitivity reaction

**Reporting of suspected adverse reactions**

Reporting suspected adverse reactions after authorization of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions via the Canada Vigilance Program.

**DRUG INTERACTIONS**

**Overview**

No drug and substance interaction studies have been performed as part of the clinical development of VOLTAREN EMULGEL Joint Pain Regular Strength 11.6 mg/g (1.16%) gel.

From the pharmacokinetic point of view, diclofenac is extensively (>99.7%) protein bound, mainly to albumin (99.4%). Binding to serum albumin is characterised by 2 classes of binding sites: the high affinity sites are likely to be shared with benzodiazepines and the low affinity site with warfarin. Diclofenac does not modify other strongly protein bound drugs but may, *in vitro*, be displaced by salicylic acid (Davies and Anderson, 1997).

There is a considerable body of literature regarding interactions of oral NSAIDs, and diclofenac in particular, with other medicinal products. No interactions with other drugs are to be expected due to very low plasma levels observed after topical application of VOLTAREN EMULGEL Joint Pain Regular Strength.
Drug-Drug Interactions

No drug-drug interactions were noted in the clinical studies presented. Isolated interaction cases have been reported for topical VOLTAREN EMULGEL Joint Pain Regular Strength from the marketplace.

Only 22 cases of possible drug interactions with VOLTAREN EMULGEL Joint Pain Regular Strength over 200 million patients exposed have been made to the company world-wide safety database since first marketing:

- Twelve cases with oral anticoagulant therapy (3 with acenocoumarol, 3 with warfarin, 2 with phenprocoumon, 2 with fluindione, and 2 unknown).
- Four cases with blood pressure increase (with anti-hypertensive product of different classes).
- Three case with blood glucose increase (in insulin-dependent and in non-insulin dependent diabetes mellitus).
- One case of a psychiatric disorder (with concomitant ofloxacin use).
- One case of a rash and vascular bleeding associated with acetylsalicylic acid. The patient was also taking heparin and a topical herbal product containing camphor, methanol and ethanol.
- One case of gastric ulcer associated with concomitant acetylsalicylic acid use.

The customary drug-drug interactions between oral NSAIDs and anticoagulants, oral antidiabetic agents and certain other classes are usually based on the high protein-binding nature of the NSAID. With significantly lower amounts of active substance in circulation following topical application compared with after oral administration, such interactions may be predicted to be very unlikely with use of VOLTAREN EMULGEL Joint Pain Regular Strength.

DOSAGE AND ADMINISTRATION

Recommended Dose and Dosage Adjustment

Adults and adolescents 16 years and older: VOLTAREN EMULGEL Joint Pain Regular Strength should be applied to the affected area 3 or 4 times daily. It should be rubbed gently into the skin.

The amount needed depends on the size of the painful area: 2g to 4g (1g equals a strip approx. 2 cm long) of gel is sufficient to treat an area of about 400-800 cm². After application, the hands should be washed, unless they are the site being treated.

The duration of treatment depends on the natural course of healing, rest and also on clinical response. The gel should not be used for more than 7 days for muscle and joint injuries, unless recommended by a doctor. Consumers should consult their doctor if the condition does not improve within 7 days, or if it gets worse.

Missed Dose

If a dose of VOLTAREN EMULGEL Joint Pain Regular Strength is missed, it should be applied when the consumer remembers and then again at the next scheduled time. A double quantity should not be applied.
OVERDOSAGE

For the management of a suspected drug overdose, contact your regional Poison Control Centre.

The low systemic absorption of topical diclofenac renders overdose very unlikely. However undesirable effects, similar to those observed following an overdose of VOLTAREN tablets, can be expected if VOLTAREN EMULGEL is inadvertently ingested (1 unit of 100 g contains the equivalent of 1 g diclofenac sodium).

In the event of accidental ingestion, resulting in significant systemic side effects, general therapeutic measures normally adopted to treat poisoning with non-steroidal anti-inflammatory drugs should be used. Gastric decontamination and the use of activated charcoal should be considered, especially within a short time of ingestion.

Management of overdose with NSAIDs essentially consists of supportive and symptomatic measures. Supportive and symptomatic treatment should be given for complications such as hypotension, renal failure, convulsions, gastro-intestinal irritation, and respiratory depression; specific therapies such as forced diuresis, dialysis or haemoperfusion are probably of no help in eliminating NSAIDs due to their high rate of protein binding and extensive metabolism.

Twenty times the oral dose of 200 mg of diclofenac in overdose produced only somnolence with no signs of toxicity (AHFS Drug Information 1999). This would represent about 65 tubes of VOLTAREN EMULGEL Joint Pain Regular Strength. In case of accidental ingestion of one tube of product, the amount of diclofenac ingested would be less than one tablet of diclofenac 50 mg (which is the most common oral unit dose).

There are five cases of overdose in the paediatric population with VOLTAREN EMULGEL Joint Pain Regular Strength listed on the company Safety Database. A 2-year-old girl swallowed a “soup spoonful”. Assuming that a spoon contains 15 ml (or grams) and that 100% of the dose was absorbed, the amount of available diclofenac would have been approximately 150 mg. No details of the other overdose are available. A 1-year-old girl and a 3-year-old boy were also reported to have swallowed unknown quantities of VOLTAREN EMULGEL Joint Pain Regular Strength with no apparent adverse events. There are 2 cases of accidental topical exposure to VOLTAREN EMULGEL Joint Pain Regular Strength in children, one to a 2-year-old boy and another to a 2-year-old child (gender not reported). No adverse events were reported in either case.

In the adult population, there is one case of an adult swallowing an unknown quantity of VOLTAREN in the database. No adverse events were reported. One report of a patient applying 1.5 tubes of VOLTAREN EMULGEL Joint Pain Regular Strength per day on his legs resulted in skin changes and “thin skin” (skin atrophy). Additionally, there is a consumer report of a patient with a history of cerebrovascular accident with left paralysis, hypertension, diabetes and epilepsy that used half a tube at the site of application in a single dose and experienced an increase in pain at the site. The database also includes a case report stated as serious where the patient became ‘intoxicated’, but there is no additional information.
The database contains a report of accidental exposure to haemorrhoids, resulting in a burning sensation. Finally, there were 3 consumer reports of accidental exposure in the eyes resulting in eye redness, eye discharge, eye irritation, and a feeling of increased intraocular pressure.

**ACTION AND CLINICAL PHARMAOCOLOGY**

**Mechanism of Action**

Diclofenac is a well characterized, potent nonsteroidal anti-inflammatory drug (NSAID) with clinically proven anti-inflammatory, analgesic and antipyretic properties (Davies & Anderson 1997). NSAIDs, including diclofenac, reduce pain principally by inhibiting formation of prostaglandins, leukotrienes and free oxygen radicals.

All non-salicylate NSAIDs reversibly block cyclooxygenase activity, which is responsible for converting arachidonic acid to prostaglandins. Diclofenac is a potent, non-selective inhibitor of COX-1 and COX-2 (preferentially COX-2), which may underlie both its therapeutic efficacy and potential side effects (Giuliano & Warner 1999). In addition, diclofenac, when compared to NSAIDs such as ibuprofen, also blocks the lipoxygenase pathway of the arachidonic acid cascade, thereby inhibiting the formation of leukotriene B4 (LTB4), which is a known pain mediator and has been shown to stimulate pain receptors in the peripheral nerves. The inhibition of lipoxygenase also prevents the pro-inflammatory and gastrointestinal damaging effects of leukotrienes (Bertolini, Ottani & Sandrini 2001). Prostaglandins, along with thromboxanes and LTB4, are responsible for several inflammatory effects. The lipoxygenase inhibition produced by diclofenac may therefore play a significant role in its efficacy as an analgesic and anti-inflammatory agent (Amadio, Cummings & Amadio, 1993; Todd & Sorkin 1988).

**Pharmacodynamics**

**Pharmacotherapeutic group**: Topical products for joint and muscular pain. Anti-inflammatory preparations, non-steroids for topical use, ATC code: M02A A15.

As with other NSAIDs, the ability of diclofenac to inhibit prostaglandin synthesis is instrumental in the anti-inflammatory response. Data from *in vitro* studies show that most topical NSAIDs are able to inhibit prostaglandin synthesis to a significant degree. In this respect, diclofenac has a high intrinsic activity, as demonstrated *in vitro* in human rheumatoid synovial microsomes (Dreiser 1994).

The pharmacodynamic properties of diclofenac have been demonstrated for each of the sodium, potassium and diethylamine salts administered either orally or topically in standard animal models of acute and chronic inflammation (Hiramatsu *et al* 1990, Kyuki *et al* 1983).

It has also been reported that topically applied diclofenac diethylamine 1.16% actively inhibited methyl nicotinate induced skin inflammation, which is known to involve prostaglandins and free arachidonic acid. Topical diclofenac was shown to exhibit a prolonged potent anti-inflammatory effect, even 48 hours after application (Duteil *et al* 1990).
The anti-inflammatory properties of VOLTAREN EMULGEL Joint Pain Regular Strength were demonstrated in two placebo-controlled, double-blind, randomized trials, one in healthy volunteers using the urate crystal induced inflammation model (NGB5) and the other in patients with chronic synovitis of the knee (NGB 8855). VOLTAREN EMULGEL Joint Pain Regular Strength proved to be superior to placebo in significantly reducing the diameter of erythema at 24 hours in study NGB 5 (p<0.05), and significantly reducing the thermal index in study NGB 8855 (p<0.04). Due to the small size of the studies, only objective parameters of erythema and thermal index could be evidenced.

**Pharmacokinetics**

**Absorption:** The quantity of diclofenac absorbed systemically from VOLTAREN EMULGEL Joint Pain Regular Strength is proportional to the size of the treated area, and depends on both the total dose applied and the degree of skin hydration. Absorption amounts to about 6% of the applied dose of diclofenac after topical application of 2.5 g VOLTAREN EMULGEL Joint Pain Regular Strength on 500 cm² skin, determined by the total renal elimination, compared with Voltaren tablets. A 10-hour occlusion leads to a 3-fold increase in the amount of diclofenac absorbed.

**Distribution:** Diclofenac concentrations have been measured from plasma, synovial tissue and synovial fluid after topical administration of VOLTAREN EMULGEL Joint Pain Regular Strength to hand and knee joints. Maximum plasma concentrations are approximately 100 times lower than after oral administration of the same quantity of diclofenac. 99.7% of diclofenac is bound to serum proteins, mainly albumin (99.4%).

**Metabolism:** Biotransformation of diclofenac involves partly glucuronidation of the intact molecule, but mainly single and multiple hydroxylation resulting in several phenolic metabolites, most of which are converted to glucuronide conjugates. Two of the phenolic metabolites are biologically active, however, to a much smaller extent than diclofenac.

**Excretion:** The total systemic clearance of diclofenac from plasma is 263 ± 56 ml/min. The terminal plasma half-life is 1-2 hours. Four of the metabolites, including the two active ones, also have short plasma half-lives of 1-3 hours. One metabolite, 3'-hydroxy-4'-methoxy-diclofenac, has a longer half-life but is virtually inactive. Diclofenac and its metabolites are excreted mainly in the urine.

**Special Populations and Conditions**

There are no gender differences in the pharmacokinetics of diclofenac. No safety or efficacy concerns relating to ethnicity have been identified from the marketplace. Davies and Anderson (1997) discuss the influence of age on diclofenac pharmacokinetics with relevance in the very young and elderly. Also, changes to the skin in the elderly will affect absorption in some patients. However, as plasma levels will be very low after topical application these factors are not a clinical concern. For similar reasons, any effect of hepatic or renal impairment on the pharmacokinetics of diclofenac is unlikely to be clinically significant. In patients with chronic hepatitis or non-decompensated cirrhosis, the kinetics and metabolism of diclofenac are the same as in patients without liver disease (Zimmerer J et al, 1982).
STORAGE AND STABILITY
VOLTAREN EMULGEL Joint Pain Regular Strength should be stored between 15 and 30°C.

SPECIAL HANDLING INSTRUCTIONS
There are no special handling instructions for VOLTAREN EMULGEL Joint Pain Regular Strength.

DOSAGE FORMS, COMPOSITION AND PACKAGING
VOLTAREN EMULGEL Joint Pain Regular Strength is a white to practically white, soft, homogenous, cream-like oil-in-water topical emulsion available in one strength (diclofenac diethylamine 1.16% w/w) and packaged in either:
- An aluminium tube with a sealing membrane, coated internally with a phenol-epoxy lacquer. The tube is closed with a polypropylene screw cap, incorporating a point to pierce the aluminium sealing membrane before first use; or
- An aluminium laminated tube [low density polyethylene / aluminium / high density polyethylene (internal layer)] fitted with a high density polyethylene shoulder and closed by a moulded seal. The tube is closed with a polypropylene screw cap, incorporating a moulded feature used to insert, twist and remove the seal before first use.

Pack sizes: 75 g, 120 g tubes.

VOLTAREN EMULGEL Joint Pain Regular Strength contains the following nonmedicinal ingredients: Carbomer, cocoyl caprylocaprate, diethylamine, isopropyl alcohol, liquid paraffin, macrogol cetostearyl ether, perfume (containing benzyl benzoate), propylene glycol, purified water.
PART II: SCIENTIFIC INFORMATION

PHARMACEUTICAL INFORMATION

Drug Substance

Proper name: Diclofenac diethylamine

Chemical name: Diethylammonium\{o\-[(2,6-dichlorophenyl)-amino]-phenyl\} acetate

Molecular formula and molecular mass: C_{18}H_{22}Cl_{2}N_{2}O_{2}, 369.3

Structural formula:

![Structural formula of Diclofenac diethylamine]

Physicochemical properties: Diclofenac diethylamine is a white to light beige crystalline powder. No polymorphic forms of diclofenac diethylamine have been observed. The solubility of diclofenac diethylamine in water is 15.8 g/L at a pH of 7.8 and a temperature of 18°C, 17.4 g/L at a pH of 7.6 and a temperature of 25°C, and 22.8 g/L at a pH of 7.6 and a temperature of 37°C. Diclofenac diethylamine has a pH range of 6.5-8.3 in a 1% solution in 10% ethanol. Diclofenac diethylamine has a pK\textsubscript{a} value of 3.9 ± 0.2 in water at 25°C.
CLINICAL TRIALS

For the indication “pain in muscles and joints injuries”, the studies NF 113 and D458 L7/D141 are considered pivotal. Study demographics and trial design for these studies are presented in Table 4.

Study results - Soft tissue trauma

Study NF113

There was a significant difference in favour of VOLTAREN EMULGEL Joint Pain Regular Strength 1.16% gel for spontaneous pain on deliberate movement on day 7 with 44% (51) of the active treatment group having no pain, 43% (50) having only moderate pain and 13% (15) marked pain compared with 35% (41), 38% (44) and 24% (28) of the subjects in the placebo group respectively. Three (3) subjects (3%) of the placebo group had very marked pain at 7 days whereas no active treatment subject had marked pain (p=0.05 for day 7 evaluation) and similar results were found for pain on pressing, also on day 7 (p=0.02). The need for rescue medication was lower in the active treatment group, and of significantly shorter duration i.e., those in the active treatment group stopped using rescue medication before those receiving placebo (p=0.02). The regression of haematoma was also faster in the active treatment group (p=0.04). These data concur with the investigator’s general assessments rating the results on day 7 as ‘excellent’ in 64% of patients receiving active treatment and 52% in those receiving placebo.
**Study D458 L7/D141**

There was a significant difference for articular pain at rest and on movement (100 mm VAS) and joint swelling at days 3 and 4 in the VOLTAREN EMULGEL Joint Pain Regular Strength treated group compared to the placebo group (p<0.001). (The mean pain at rest (mornings) fell from 61.15 on the VAS to 24.13 by day 4 for the active treatment group compared to a fall from 53.33 at baseline to 29.71 on day 4 for the placebo treated group- p<0.001.) Patients withdrew as they got better and so by the 7th day, only those who had not yet healed still remained in the study. At this point there was no difference between active and placebo for joint swelling. Similar numbers of patients in each group required rescue analgesia. 60% of actively treated patients were able to stop using the gel before the 14th day as they were free of symptoms compared with 38% of the placebo group. Interruptions for inadequate efficacy occurred in the placebo group only (2 subjects). During the first 10 days of treatment, nearly twice as many active treatment patients became free of symptoms than the placebo treated group (n=17 and n=8 respectively, p value not given in final study report). This gives an indication of the effect of treatment on the natural time course for pain relief.

**DETAILED PHARMACOLOGY**

Systemic absorption of diclofenac following topical application of VOLTARNE EMULGEL Joint Pain Regular Strength is about 6% of the administered dose and the peak plasma levels attained are 50 times (repeated doses) to 100 times (single dose) lower than those observed after an oral dose. Supportive of efficacy is adequate tissue concentrations of diclofenac in the targeted area after topical application. Overall, VOLTAREN EMULGEL Joint Pain Regular Strength can be expected to produce a direct anti-inflammatory and analgesic effect with significantly less AEs than after the oral administration of diclofenac.

**Pharmacokinetics**

Evidence in humans and animals with topical NSAIDs, including diclofenac, demonstrates lower plasma concentrations than with systemically administered NSAIDs, while drug concentrations in the soft tissues around the area of application are still of a magnitude considered sufficient to exert an anti-inflammatory response. Reviews of the therapeutic effectiveness and PK of diclofenac include Chlud & Wagener (1987, 1991), Chlud (1999), Grahame (1995), Davies & Anderson (1997), and Vaile & Davies (1998).

**Percutaneous Absorption, Distribution, Metabolism, Excretion**

Absorption of various NSAIDs, including diclofenac, occurs to a depth of at least 3-4 mm through the underlying dermis and subcutaneous tissue (Singh & Roberts 1994). At that level, uptake of drug from the dermal microcirculation into the systemic circulation occurs but the concentration of drug in these layers is always higher than the plasma concentration. Although only a small proportion of the dose is absorbed, the skin acts as reservoir from which there is a sustained release of drug into underlying tissues (Dreiser 1994, Sioufi et al 1994). The concentration of the drug is higher in the dermis and subcutaneous tissue below the application site than at greater depths where the drug concentration becomes less than the corresponding plasma concentration. Thus, anti-inflammatory effects at deeper tissue levels may be influenced by both direct and systemic drug concentrations (Singh & Roberts 1994).
When VOLTAREN EMULGEL Joint Pain Regular Strength is applied topically, the amount of diclofenac absorbed through intact skin is proportional to the contact time and skin area covered and depends on the total topical dose and the hydration of the skin.

Systemic absorption amounts to approximately 3-7% of the dose of diclofenac after topical application of 2.5g VOLTAREN EMULGEL Joint Pain Regular Strength per 500 cm² skin, left for 12 hours on non-occluded skin (Riess et al 1986, Davies & Anderson 1997). Plasma drug concentrations are well below those observed after a standard oral or intramuscular dose and below the range at which systemic AEs usually occur. Maximum plasma concentrations of diclofenac after topical administration of VOLTAREN EMULGEL Joint Pain Regular Strength are between 50 (repeated dose) and 100 (single dose) times lower than after oral administration of VOLTAREN tablets (Riess et al 1986). The steady state is reached after 2 days of twice-daily administration and the low plasma levels remain in the same range over the full day indicating prolonged absorption from the application site (Sioufi et al 1994). Absorption of diclofenac through the skin can be increased by 3-10 times after application of an occlusive dressing.

Report 17727B-510.20-02-01-B describes a single and multiple dose (7 days), open, randomized, three-way cross-over, comparative bioavailability trial of VOLTAREN EMULGEL Joint Pain Regular Strength, diclofenac enteric coated tablet and a diclofenac patch formulation that was in development in the Company, in 24 healthy volunteers. The main pharmacokinetic findings are summarized in Table 5.

tₘₐₓ values are median (range), other values are geometric means (range); N=24 for patch and gel, N=23 for the tablet

As expected, these data demonstrate that the relative bioavailability of VOLTAREN EMULGEL Joint Pain Regular Strength versus tablets remained low (Cₘₐₓ <2% and 3% and AUC 4% and 13% respectively) after first and last administration.

Diclofenac is extensively protein bound in plasma (>99.7%), mainly to albumin (99.4%) (Reiss et al 1978). The liver is the primary site of metabolism for diclofenac (Davies & Anderson 1997) to virtually inactive metabolites (Stierlin, Faigle & Colombi 1978, Stierlin et al 1979, Faigle et al 1988). The total systemic clearance of diclofenac from plasma is 263±56 ml/min
Diclofenac and its metabolites are excreted mainly in urine (60%).

Diclofenac in target tissues

After topical administration of VOLTAREN EMUGLEL Joint Pain Regular Strength to hand and knee joints in patients, diclofenac can be measured in the synovial tissue and synovial fluid with concentrations as high as 20 times the plasma concentration (Riess et al 1986). In study C.R.B. R8/1986 plasma concentrations of diclofenac recorded on the fourth day in 7 patients ranged from 6 to 52 ng/ml with one extreme value of 698 ng/ml. In synovial fluid, the concentrations of diclofenac ranged from 119 to larger than 3320 ng/ml and in synovial tissue ranged from 131 to 1740 ng/ml. In the other patient study T13/1987 diclofenac could not be detected in plasma samples. In synovial fluid from knee joints the diclofenac concentrations were in the range of 6.5-22.1 ng/g sample. These patient studies confirm that topically applied diclofenac will reach the target tissues (soft tissue/joint) at sufficient concentrations to exert a therapeutic response. Relevant publications include Radermacher et al (1991), Gondolph-Zink & Gronwald (1996), Day et al (1999), Kurowski & Dunky (1992), Chlud & Wagener (1987, 1991), Chlud (1999), Dreiser (1994), and Giuliano & Warner (1999).

Drug and substance interactions

The customary drug-drug interactions between oral NSAIDs and anticoagulants and oral antidiabetic agents, for example, are usually consequent to the high protein-binding of the NSAID. With a significantly lower amount of active substance in circulation following topical application than after oral administration, such interactions may be predicted to be very unlikely with VOLTAREN EMULGEL Joint Pain Regular Strength.

Pharmacokinetics in special patient populations

There are no gender differences in the pharmacokinetics of diclofenac. No safety or efficacy concerns relating to ethnicity have been identified from the marketplace. Davies and Anderson (1997) discuss the influence of age on diclofenac pharmacokinetics with relevance in the very young and elderly. Also, changes to the skin in the elderly will affect absorption in some patients. However, as plasma levels will be very low after topical application these factors are not a clinical concern. For similar reasons, any effect of hepatic or renal impairment on the pharmacokinetics of diclofenac is unlikely to be clinically significant. In patients with chronic hepatitis or non-decompensated cirrhosis, the kinetics and metabolism of diclofenac are the same as in patients without liver disease (Zimmerer J et al, 1982).

Pharmacodynamics

Pharmacodynamics studies - anti-inflammatory activity

As with other NSAIDs, the ability of diclofenac to inhibit prostaglandin synthesis is instrumental in the anti-inflammatory response. Data from in vitro studies show that most topical NSAIDs are able to inhibit prostaglandin synthesis to a significant degree. In this respect, diclofenac has a
high intrinsic activity, as demonstrated in vitro in human rheumatoid synovial microsomes (Dreiser 1994).

Prostaglandins, along with thromboxanes and leukotriene B4 (LTB4), are responsible for several inflammatory effects such as vasodilatation, increased vascular permeability, hyperalgesia and increased platelet aggregation. Free oxygen radicals, also mediators of inflammation, are by-products of prostaglandin synthesis. Diclofenac non-specifically inhibits the cyclo-oxygenase pathway with a subsequent reduction in prostaglandin, prostacyclin and thromboxane production. Although non specific, diclofenac inhibits preferentially COX-2 pathway (Giuliano & Warner 1999). The production of leukotrienes is also decreased following the administration of diclofenac, suggesting an inhibitory effect on the lipoxygenase pathway with direct impact on LTB4 and inhibition of pain (Amadio, Cummings & Amadio 1993).

The pharmacodynamic properties of diclofenac have been demonstrated for each of the sodium, potassium and diethylamine salts administered either orally or topically in standard animal models of acute and chronic inflammation (Hiramatsu et al 1990, Kyuki et al 1983).

It has also been reported that topically applied diclofenac diethylamine 1.16% actively inhibited methyl nicotinate induced skin inflammation, which is known to involve prostaglandins and free arachidonic acid. Topical diclofenac was shown to exhibit a prolonged potent anti-inflammatory effect, even 48 hours after application (Duteil et al 1990).

The anti-inflammatory properties of VOLTAREN EMULGEL Joint Pain Regular Strength were demonstrated in two placebo-controlled, double-blind, randomized trials (refer to Table 6), one in healthy volunteers using the urate crystal induced inflammation model (NGB5) and the other in patients with chronic synovitis of the knee (NGB 8855). VOLTAREN EMULGEL Joint Pain Regular Strength proved to be superior to placebo in significantly reducing the diameter of erythema at 24 hours in study NGB 5 (p<0.05), and significantly reducing the thermal index in study NGB 8855 (p<0.04). Due to the small size of the studies, only objective parameters of erythema and thermal index could be evidenced.

Duteil, et al (1990) compared the potency of VOLTAREN EMULGEL Joint Pain Regular Strength with that of five other topical NSAIDs (indomethacin, ibuprofen, phenylbutazone,
bufexamac and niflumic acid) and three topical corticosteroids (clobetasol, hydrocortisone and hydrocortisone butyrate) in healthy volunteers. Four hours after a single application of each drug to the forearm, inhibition of methyl-nicotinate induced inflammation was greatest with VOLTAREN EMULGEL Joint Pain Regular Strength and indomethacin cream (84% and 85%, respectively, relative to a control vehicle). VOLTAREN EMULGEL Joint Pain Regular Strength demonstrated the most sustained anti-inflammatory effect, providing 75% inhibition when re-tested 48 hours after application.

Pharmacodynamics studies - analgesic activity

Interestingly, diclofenac also blocks the lipoxygenase pathway of the arachidonic cascade, thereby inhibiting the formation of LTB4 which is known to be a pain mediator stimulating the pain receptors in the peripheral sensory nerves (Martin, et al 1988). Inhibition of lipoxygenase also decreases the formation of the slow-reacting substance of anaphylaxis (composed of leukotriene C4, D4 and E4).

In animals, using the Randall and Sellito's test, VOLTAREN EMULGEL Joint Pain Regular Strength has been shown to increase the pain threshold after a single subcutaneous injection of yeast suspension (Kyuki et al 1983).
TOXICOLOGY

The toxicology of VOLTAREN EMULGEL Joint Pain Regular Strength 11.6 mg/g Gel was investigated in a series of in vivo studies, including acute and three-month repeat dose toxicity, but concentrating particularly on potential local tolerance and photo-safety issues, as outlined in Table 7 below.

</table>

VOLTAREN EMULGEL Joint Pain Regular Strength 11.6 mg/g Gel was generally well tolerated. The acute toxicity of diclofenac diethylamine was essentially the same as that of diclofenac sodium when expressed in terms of the base. There was no evidence of any significant local irritancy, unexpected toxicity or of any photo-safety concerns.

There have been no other studies specifically designed to investigate toxicity of the drug substance, diclofenac diethylamine, or of the drug product, VOLTAREN EMULGEL Joint Pain Regular Strength 11.6 mg/g Gel. The non-clinical toxicology of diclofenac sodium is directly relevant to diclofenac diethylamine and is summarized below.

Single dose experiments in mice, rats, rabbits and dogs indicate an acute intravenous LD\textsubscript{50} in the region of 100 mg/kg and an oral LD\textsubscript{50} nearer 200 mg/kg with little evidence to suggest any significant influence of age or sex on the outcome. An oral study in baboons suggests significantly greater tolerance with a probable LD\textsubscript{50} of more than 600 mg/kg. Death following intravenous administration was usually attributed to respiratory or cardiac failure, those following oral administration to gastrointestinal problems.

Repeat dose oral gavage studies of up to 6 months duration in rats indicate a no observed adverse effect level (NOAEL) of 1 to 2 mg/kg/day. A similar result was obtained in a one-month mouse
study by dietary administration. At doses greater than 4 mg/kg/day, deaths were common and 
usually associated with mild anaemia, neutrophilia, disturbance of plasma proteins, increased 
extramedullary haematopoiesis and, most prominently, ulceration of the gastrointestinal tract 
with accompanying peritonitis. These latter were commonly associated with hypertrophy or 
reactive hyperplasia of the mesenteric lymph nodes.

In a series of baboon studies, similar changes were apparent with deaths consistently seen within 
3 months of treatment at 20 mg/kg/day or more. In a 1-year study, 5 of 14 animals treated at 
15 mg/kg/day had died by 8.5 months when this dosage was reduced to 10 mg/kg/day. Both 
constipation and diarrhoea were apparent and there was a high incidence of skin ulcers the 
severity of which was treatment-related. In both three-month studies, but not in the one-year 
study, there was evidence of nephropathy at the high dose with increased blood urea nitrogen and 
disturbance of plasma electrolytes in one study. In the one-year study only and at the high dose 
only (where 13 of 14 animals died despite a dosage reduction) adrenal cortical hyperplasia was 
noted in several animals. Other changes seen in baboons were essentially similar to those in rats 
and the deaths were all associated with gastrointestinal changes. Gastrointestinal changes were 
seen at the lowest dosages studied in baboons (around 3-5 mg/kg/day) but were generally 
considered to reflect an exacerbation of pre-existing conditions rather than a primary effect of 
treatment with diclofenac.

The potential genetic toxicology of diclofenac sodium has been studied in a wide variety of in 
vitro and in vivo studies. Most of these studies were carried out many years ago and include:

- Ames tests of the drug, of urine and bile concentrates, and of the major hydroxy-metabolites 
of diclofenac.
- In vitro mammalian cell mutation studies of diclofenac sodium and its hydroxy-metabolites.
- In vivo chromosome aberration and nucleus anomaly tests in Chinese hamsters after both 
short-term treatment and repeated administration for 12 weeks.
- Metaphase analyses of spermatogonia and spermatocytes following five administrations.
- A dominant lethal study in mice.

None of these studies gave any indication of a positive outcome. Recently fully GLP compliant 
in vitro photo-mutagenicity and photo-chromosome aberration studies have been carried out. 
The photo-mutagenicity study (Ames test) was also negative. Chromosome aberrations were 
seen in the other study at 25 µg/ml and with 16 minutes of UV radiation. These conditions were 
associated with a reduced mitotic index and the apparently positive result is attributed to 
cytotoxicity. No chromosome aberrations were seen at lower doses of UV or at lower 
concentrations of diclofenac. An additional conventional in vivo GLP compliant chromosome 
aberration study has also been completed with diclofenac sodium and was also negative.

One mouse and two rat carcinogenicity studies have been conducted. Exposure levels, as judged 
from plasma concentration data obtained during the more recent of these studies, were 12-
45 ng/g in mice at the NOAEL (0.3 mg/kg/day) and 10-48 ng/ml in rats at the lowest dosage 
(0.25 mg/kg/day). In all 3 studies there was a dosage-related increase in mortality at 1 and 
2 mg/kg/day with only isolated animals surviving at the high dose. Most deaths were associated 
with gastrointestinal ulceration and peritonitis. There were few changes that could be ascribed to 
treatment at lower dosages (0.1 to 0.5 mg/kg/day) and there was no treatment-related increase in 
the incidences of benign or malignant tumours in any of these studies.
Reproduction toxicity has been assessed in a series of pre-ICH design studies, including Segment I and III studies in rats and a variety of Segment II studies in mice, rats and rabbits. Almost all studies included treatment at toxic dosages and death of the dams, usually attributed to peritonitis, was a common finding. Treatment with diclofenac sodium in the Segment I and III studies was generally associated with a slight increase in gestation and occasional dystocia resulting in increased peri-natal mortality. Even discounting this, there was usually an increase in embryo-foetal and/or perinatal losses. Birth weight was reduced. Foetal changes extended to the lowest dosage examined, 2 mg/kg/day, in both studies. Other than deaths associated with dystocia, post-natal survival was not affected.

In the Segment II studies in mice, there was no clear effect of treatment at 2 or 4 mg/kg/day when given orally, even when administered through days 0-17 of gestation. Reductions in foetal numbers and reduced ossification at higher dosages were associated with severe maternal toxicity. In oral rat studies a similar picture emerged. There were some minor contradictory findings at 4 mg/kg/day but none at 2 mg/kg/day and clear effects at higher dosages, including reduced ossification, that were attributed to maternal toxicity. An intramuscular study indicated no changes in the foetuses at 10 mg/kg/day, despite maternal sedation and local injection site responses. In a GLP compliant subcutaneous rat study, however, minimally reduced ossification was identified at 1.2 mg/kg/day; 0.4 mg/kg/day was a NOAEL. In an oral rabbit Segment II study, 5 mg/kg/day was a clear NOAEL, changes at 10 mg/kg/day included increased embryonic and foetal resorptions and reduced foetal ossification in three foetuses. An intramuscular rabbit study identified 3 mg/kg/day as the NOAEL with increased abortions and dead foetuses, reduced number of fully formed foetuses and reduced ossification, and reduced foetal viability at higher dosages, associated with maternal toxicity.

PART III: CONSUMER INFORMATION

VOLTAREN EMULGEL JOINT PAIN
REGULAR STRENGTH
(Diclofenac diethylamine gel)

This leaflet is part III of a three-part "Product Monograph" published when Voltaren Emulgel Joint Pain Regular Strength was approved for sale in Canada and is designed specifically for Consumers. This leaflet is a summary and will not tell you everything about Voltaren Emulgel Joint Pain Regular Strength.

Read all of this leaflet carefully before you start using this medicine because it contains important information for you.

• Keep this leaflet. You may need to read it again.
• Contact your doctor or pharmacist if you have any questions about the drug or need more information or advice.

ABOUT THIS MEDICATION

What the medication is used for:

For the relief of aches and pain associated with acute, localized joint or muscle injuries such as sprains, strains or sports injuries (e.g. sore ankles, knees, hands or shoulder). Rest may also be helpful to assist the relief of associated discomfort.

What it does:

Voltaren Emulgel Joint Pain Regular Strength is specially formulated for rubbing into the skin to relieve acute pain affecting the joints and muscles. The active substance, diclofenac, is one of the group of medicines called non-steroidal anti-inflammatory drugs (NSAIDs) that work within the body by blocking the production of particular substances, called prostaglandins, which are involved in the development of pain and inflammation.

When it should not be used:

• If you are currently taking diclofenac or any other oral non-steroidal anti-inflammatory drug (NSAID) which are used to treat pain, fever or inflammation, such as ibuprofen or acetylsalicylic acid (ASA). If you are not sure, ask your doctor or pharmacist.
• If in the past you have had allergic reactions to diclofenac or any other NSAIDs such as ibuprofen or ASA or naproxen.
• If you have attacks of asthma, urticaria (hives), or acute rhinitis (nasal inflammation, irritation or stuffy nose that lasts less than 6 weeks), swelling of the face or tongue or runny nose after taking ASA or other NSAIDs.
• If you are allergic to any of the nonmedicinal ingredients in the gel (see list of nonmedicinal ingredients).
• If you are in the last 3 months of pregnancy as it could harm your unborn child or cause problems at delivery.
• If you are breast-feeding.

If any of these applies to you, do not use this medicine. If you are not sure, ask your doctor or pharmacist.

What the medicinal ingredient is:

Diclofenac diethylamine

What the nonmedicinal ingredients are:

Carbomer, cocoyl caprylocaprate, diethylamine, isopropyl alcohol, liquid paraffin, macrogol cetostearyl ether, perfume (containing benzyl benzoate), propylene glycol, purified water. Propylene glycol and benzyl benzoate, may cause mild localized skin irritation in some people.

What dosage forms it comes in:

The product comes in tubes of 75 g and 120g. The strength of medicinal ingredient in all tubes is 11.6 mg/g (1.16% w/w). The gel is white, cooling, non-greasy, non-staining, cream-like gel.

WARNINGS AND PRECAUTIONS

BEFORE you use Voltaren Emulgel Joint Pain Regular Strength talk to your doctor or pharmacist if:

• You have a history of stomach ulcers or take medication for such gastrointestinal disorders.
• You are pregnant, think you may be pregnant or are planning to have a baby.
• You are taking, or have recently taken, any other medicines, including Over the Counter drugs.

This product is not intended for use in children under the age of 16.

Do not apply to cuts or open wounds or to skin that has a rash or eczema. Discontinue the treatment if a skin rash develops after applying the product.

A brace or wrap commonly used for injuries like sprains can be used but do not wrap the skin with an airtight (plastic) or occlusive dressing when using Voltaren Emulgel Joint Pain Regular Strength.

In very rare cases, your skin may be more sensitive to sunlight while using this product. Use caution during sun exposure or when using tanning booths/sun lamps. Possible signs are sunburn with itching, swelling and blistering.

Be careful not to get it in your eyes. If this happens, rinse your eyes well with clean water and tell a doctor or a pharmacist.

Voltaren Emulgel Joint Pain Regular Strength is for EXTERNAL USE ONLY.

Do not use it in the mouth, vaginal or anal areas. Never swallow it.
INTERACTIONS WITH THIS MEDICATION

Check with your doctor or pharmacist if you are taking any other NSAIDs (ibuprofen or acetylsalicylic acid) or anticoagulants (blood thinners), high blood pressure medication, oral anti-diabetic agents, fluoroquinolone antibiotics (i.e., ofloxacin) or are taking medication for peptic ulcers, gastroesophageal disease or to control excess acidity. If you suspect a drug interaction, notify your doctor or pharmacist.

PROPER USE OF THIS MEDICATION

Usual dose:
For adults and adolescents 16 years and older:
• Apply Voltaren Emulgel Joint Pain Regular Strength 3 to 4 times a day. The amount needed will vary depending upon the size of the painful or swollen area. Usually, a strip approximately 2 cm long will be sufficient to cover a 200 cm² area.
• Before first use, unscrew and remove the cap. Use the reverse side of the cap to remove the seal from the tube.
• Gently squeeze out a small amount of gel from the tube and apply to the painful or swollen area, slowly rubbing into the skin. You may notice a slight cooling effect when you rub the gel in.
• Wash your hands after rubbing in Voltaren Emulgel Joint Pain Regular Strength to avoid accidental contact with the mouth and eyes, unless of course they are the site being treated.

The gel should not be used for more than 7 days for muscle and joint injuries, unless recommended by a doctor. Talk to your doctor if your condition does not improve within 7 days, or if it gets worse.

Overdose Management Information:

In case of drug overdose, contact a health care practitioner, hospital emergency department or regional Poison Control Centre immediately, even if there are no symptoms.

If you use more gel than you should wipe off the surplus gel with a tissue.
If you or a child accidentally swallows the gel, contact your doctor immediately.

Missed Dose:
If you miss applying Voltaren Emulgel Joint Pain Regular Strength at the correct time, apply it when you remember and then next apply it at the usual time. Do not apply a double quantity.

SIDE EFFECTS AND WHAT TO DO ABOUT THEM

Itching, reddening or slight irritation of the skin are common after use of Voltaren Emulgel Joint Pain Regular Strength. These symptoms are usually mild, passing and harmless. If you are concerned, tell a doctor or pharmacist. Discontinue the treatment if a skin rash develops after applying the product.

This is not a complete list of side effects. For any unexpected effects while taking Voltaren Emulgel Joint Pain Regular Strength, contact your doctor or pharmacist.
**HOW TO STORE IT**

**Voltaren Emulgel** Joint Pain Regular Strength should be stored between 15°C and 30°C.

**Voltaren Emulgel** Joint Pain Regular Strength should not be stored after the expiry date shown on the carton and tube.

Keep out of the reach and sight of children.

Do not use after the expiry date stated on the label.

**REPORTING SUSPECTED SIDE EFFECTS**

You can help improve the safe use of health products for Canadians by reporting serious and unexpected side effects to Health Canada. Your report may help to identify new side effects and change the product safety information.

3 ways to report:

Online at MedEffect;
By calling 1-866-234-2345 (toll-free);
By completing a Consumer Side Effect Reporting Form and sending it by:

Fax to 1-866-678-6789 (toll-free), or
Mail to: Canada Vigilance Program
Health Canada, Postal Locator 0701E
Ottawa, ON
K1A 0K9

Postage paid labels and the Consumer Side Effect Reporting Form are available at MedEffect.

NOTE: Contact your health professional if you need information about how to manage your side effects. The Canada Vigilance Program does not provide medical advice.
