Pr ZEVTERA®

Ceftobiprole medocaril powder for injection

500 mg ceftobiprole as 666.6 mg ceftobiprole medocaril sodium per vial

ATC code: J01DI (Other cephalosporins and penems)
Therapeutic Classification: Antibiotic

INDICATIONS AND CLINICAL USE

ZEVERTA (ceftobiprole medocaril) is indicated for the treatment of the following infections when caused by susceptible strains of the designated microorganisms in patients 18 years of age and older:

- Hospital-acquired pneumonia (HAP), excluding ventilator-associated pneumonia (VAP)
  Caused by: *Staphylococcus aureus* (including MRSA), *Streptococcus pneumoniae*, *Escherichia coli*, and *Klebsiella pneumoniae* (see DOSAGE AND ADMINISTRATION).

- Community-acquired pneumonia (CAP)
  Caused by: *Staphylococcus aureus* (including MRSA), *Streptococcus pneumoniae*, *Escherichia coli*, *Klebsiella pneumoniae*, and *Haemophilus influenzae* (see DOSAGE AND ADMINISTRATION).

To reduce the development of drug-resistant bacteria and maintain the effectiveness of ZEVERTA and other antibacterial drugs, ZEVERTA should be used only to treat or prevent infections that are proven or suspected to be caused by susceptible bacteria. When culture and susceptibility information are available, they should be considered in selecting or modifying antibacterial therapy. In the absence of such data, local epidemiology and susceptibility patterns may contribute to the empiric selection of therapy.

Appropriate specimens for bacteriological examination should be obtained in order to isolate and identify the causative organisms and to determine their susceptibility to ceftobiprole. Empiric therapy with ZEVERTA may be initiated before the results of these tests are known. Once these results are available, antimicrobial therapy should be adjusted (see DOSAGE AND ADMINISTRATION).
Geriatrics (> 65 years of age):
Evidence from clinical studies suggests that no dose adjustment is necessary in geriatric patients, except in cases of moderate to severe renal impairment (see DOSAGE AND ADMINISTRATION, Recommended dose and dosage adjustment, Renal impairment).

Pediatrics (< 18 years of age):
As the safety and efficacy of ZEVTERA in children aged < 18 years have not yet been established, ZEVTERA is not recommended for use in pediatric patients.

CONTRAINDICATIONS
ZEVTERA is contraindicated in:
- Patients who are hypersensitive to this drug or to any ingredient in the formulation or component of the container. For a complete listing, see the DOSAGE FORMS, COMPOSITION AND PACKAGING
- Patients who are hypersensitive to the cephalosporin class of antibacterials.
- Patients with immediate and severe hypersensitivity (e.g., anaphylactic reaction) to any other type of beta-lactam antibacterial agent (e.g., penicillins or carbapenems).

WARNINGS AND PRECAUTIONS

<table>
<thead>
<tr>
<th>Serious Warnings and Precautions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Serious and occasionally fatal hypersensitivity (anaphylactic) reactions have been reported in patients receiving β-lactam antibiotics. These reactions are more likely to occur in individuals with a history of sensitivity to multiple allergens. Anaphylaxis, including anaphylactic shock, has been observed with ZEVTERA. Before therapy with ZEVTERA is instituted, careful inquiry should be made to determine whether the patient has had a previous hypersensitivity reaction to other cephalosporins, penicillins or other allergens. SERIOUS ACUTE HYPERSENSITIVITY (ANAPHYLACTIC) REACTIONS REQUIRE ADEQUATE EMERGENCY MEASURES (see Hypersensitivity Reactions).</td>
</tr>
</tbody>
</table>

Susceptibility / resistance
Prescribing ZEVTERA in the absence of proven or strongly suspected bacterial infection is unlikely to provide benefit the patient and risks development of drug-resistant bacteria.

General
Superinfection with non-susceptible organisms
As with other antibiotics, prolonged use of ZEVTERA may result in overgrowth of non-susceptible organisms, including fungi. Appropriate measures should be taken if evidence of superinfection occurs during therapy.
Clinical efficacy against specific pathogens

Susceptibility to Enterobacteriaceae

Ceftobiprole, like other cephalosporins is susceptible to hydrolysis that may be produced by Enterobacteriaceae including many of the extended-spectrum beta-lactamases (ESBLs), serine carbapenemases, class B metallo-beta-lactamases (among others). Therefore, information on the prevalence of Enterobacteriaceae producing extended-spectrum beta-lactamases (ESBLs) should be taken into consideration when selecting ZEVTERA for treatment.

Efficacy in HAP by multi-drug resistant *S. pneumoniae* (*S. pneumoniae*/MDRSP)

Clinical efficacy data were very limited in MDRSP infected pneumonia subjects in the clinical study involving non-VAP HAP patients. Therefore, ceftobiprole is not recommended in the treatment of HAP caused by this pathogen.

Patients with ventilator-associated pneumonia (VAP)

ZEVTERA has not been shown to be effective in the treatment of patients with VAP. ZEVTERA should not be initiated in patients with VAP.

Limitations of clinical data

There is no experience with ceftobiprole in the treatment of HAP and CAP in HIV-positive patients, patients with neutropenia, immunocompromised patients, and patients with myelosuppression. Caution is advised when treating such patients.

Precipitation with calcium-containing solutions

Precipitation can occur when ZEVTERA is mixed with calcium-containing solutions in the same intravenous administration line. Therefore, ZEVTERA and calcium-containing solutions, except Lactated Ringer’s solution for injection, must not be mixed or administered simultaneously in the same intravenous line.

Effects on ability to drive and use machines

No studies on the effects on the ability to drive and use machines have been performed. However, since dizziness is a common undesirable effect, driving and using machines is not recommended while on treatment with ZEVTERA.

Dosing above the recommended dose range

There is no clinical experience with ZEVTERA doses higher than the recommended 500 mg administered every eight hours.

Patients on a controlled sodium diet

This medicinal product contains approximately 1.3 mmol (29 mg) sodium per dose. Patients on a controlled sodium diet need to take this into account.
Endocrine and metabolism

Potential interference with urine glucose test

During treatment with ZEVTERA it is recommended that an enzymatic method to detect glucosuria be used, because of potential interference with tests using the copper reduction technique.

Gastrointestinal

_Clostridium difficile-associated diarrhea_

Antibacterial agent-associated colitis and pseudomembranous colitis have been reported with the use of ZEVTERA and may range in severity from mild to life-threatening. This diagnosis should be considered in patients with diarrhea or symptoms of colitis, pseudomembranous colitis, toxic megacolon, or perforation of the colon subsequent to the administration of any antibacterial agent.

_Clostridium difficile-associated diarrhea_ (CDAD) has been reported to occur over 2 months after the administration of antibacterial agents.

Treatment with antibacterial agents may alter the normal flora of the colon and may permit overgrowth of _Clostridium difficile_. _Clostridium difficile_ produces toxins A and B, which contribute to the development of CDAD. CDAD may cause significant morbidity and mortality. CDAD can be refractory to antimicrobial therapy. If the diagnosis of CDAD is suspected or confirmed, appropriate therapeutic measures should be initiated. Mild cases of CDAD usually respond to discontinuation of antibacterial agents not directed against _Clostridium difficile_. In moderate to severe cases, consideration should be given to management with fluids and electrolytes, protein supplementation, and treatment with an antibacterial agent clinically effective against _Clostridium difficile_. Medicinal products that inhibit peristalsis should not be given. Surgical evaluation should be instituted as clinically indicated since surgical intervention may be required in certain severe cases (see ADVERSE REACTIONS).

Immune

Hypersensitivity Reactions

As with all beta-lactam antibacterial agents, serious and occasionally fatal hypersensitivity (anaphylactic) reactions have been reported. In case of severe hypersensitivity reactions, treatment with ZEVTERA must be discontinued immediately.

SERIOUS ACUTE HYPERSENSITIVITY (ANAPHYLACTIC) REACTIONS REQUIRE ADEQUATE EMERGENCY MEASURES.

Before beginning treatment, it should be established whether the patient has a history of severe hypersensitivity reactions to ZEVTERA, to other cephalosporins or to any other type of beta-lactam agent. Caution should be used if ZEVTERA is given to patients with a history of non-severe hypersensitivity to other beta-lactam agents.
Neurologic

Patients with pre-existing seizure disorders

Seizures have been associated with the use of ZEVTERA. Seizures occurred most commonly in patients with pre-existing CNS/seizure disorders during treatment with ZEVTERA. Therefore caution is advised when treating these patients.

Renal

Renal clearance (CL\textsubscript{CR}) should be measured prior to ceftobiprole dosing.

Due to limited clinical data and an expected increased exposure of ZEVTERA and its metabolite, ZEVTERA should be used with caution in patients with severe renal impairment. Dose adjustments for patients with moderate renal impairment (CL\textsubscript{CR} 30 to < 50 mL/min) and patients with end-stage renal disease, and prolongation of the infusion duration for patients with supranormal creatinine clearance (CL\textsubscript{CR} > 150 mL/min) are discussed in the DOSAGE AND ADMINISTRATION, Recommended dose and dosage adjustment, Renal impairment section.

Renal toxicity in animals

In animals, reversible renal toxicity was observed at high doses of ZEVTERA and was associated with precipitation of drug-like material in the distal tubules. Although the clinical significance of this observation is unknown, it is advisable to correct hypovolemia to maintain normal urinary output in patients receiving ZEVTERA.

Potential interference with serum creatinine test

It is not known whether ceftobiprole, like some other cephalosprins, interferes with the alkaline picrate assay to measure serum creatinine (Jaffé reaction), which may lead to erroneously high creatinine measurements. During treatment with ZEVTERA it is recommended that an enzymatic method of measuring serum creatinine be used.

Special populations

Pregnant women: There are no adequate and well-controlled studies with ZEVTERA in pregnant women. Animal studies do not indicate direct or indirect harmful effects with respect to pregnancy, embryonal/fetal development, parturition or postnatal development. As no data in exposed human pregnancies are available, ZEVTERA should not be used during pregnancy unless strictly necessary.

As no data in exposed human pregnancies are available, ZEVTERA should not be used during pregnancy unless strictly necessary.

Nursing women: Animal studies have shown the excretion of ceftobiprole/metabolites in milk at low concentrations. It is unknown whether ceftobiprole is excreted in human milk and the risk of diarrhea and fungal infection of the mucous membranes in the breast-fed infant cannot be excluded. The possibility of sensitization should be taken into account. A decision must be made
whether to discontinue breast-feeding or to discontinue/abstain from ZEVTERA therapy, taking into account the benefit of breast feeding for the child and the benefit of therapy for the woman.

**Pediatrics (< 18 years of age):** ZEVTERA is not recommended for use in pediatric patients.

**Geriatrics (> 65 years of age):** No dose adjustment is necessary in geriatric patients, except in cases of moderate to severe renal impairment (see **DOSAGE AND ADMINISTRATION, Recommended dose and dosage adjustment, Renal impairment**).

## ADVERSE REACTIONS

### Adverse drug reaction overview

The most common adverse drug reactions reported in ≥ 2% in patients treated with ZEVTERA in pneumonia studies are: infusion site reactions (6.5%), hypersensitivity (5.5%), nausea (4.3%), diarrhea (4.2%) and vomiting (3.3%), hyponatremia (2.7%), and phlebitis (2.3%). The majority (82.4%) of adverse events were reported as mild to moderate in severity. Ceftobiprole was discontinued due to an adverse event in 10.3% of subjects compared with 7.3% for all comparators.

Less frequently reported, but more serious, adverse reactions include thrombocytopenia, agranulocytosis, anaphylaxis, *Clostridium difficile* colitis, convulsion, agitation (including anxiety, panic attacks and nightmares), and renal failure.

### Clinical trial and post-marketing adverse drug reactions

Because clinical studies are conducted under very specific conditions, the adverse reaction rates observed in the clinical studies of ZEVTERA may not reflect the rates observed in practice, and should not be compared to the rates in the clinical studies of another drug. Adverse drug reaction information from clinical studies is useful for identifying drug-related adverse events and for approximating rates.

The following adverse reactions were reported during clinical study therapy of community-acquired pneumonia (CAP) and hospital acquired pneumonia (HAP), in which 310 and 386 subjects, respectively, received ceftobiprole at a dose of 500 mg three times daily (Table 1):

Page 8 of 35
The following adverse drug reactions were reported in study CAP 3001 1–3 days after switch from intravenous to oral formulation of ceftobiprole (N=166): diarrhea (1.2%), nausea (0.6%), candidiasis (0.6%), hypocalcemia (0.6%), hyponatremia (0.6%), dizziness (0.6%), and rash (0.6%).

Less common clinical trial adverse drug reactions reported in pneumonia studies (<1%)

**Blood and lymphatic system:** leukopenia, anemia, thrombocytosis, thrombocytopenia

**Gastrointestinal disorders:** abdominal pain, dyspepsia

**General disorders and administration site conditions:** peripheral edema, pyrexia

**Immune system disorders:** anaphylaxis

**Infections and infestations:** *Clostridium difficile* colitis

**Investigations:** increased LDH, increased alkaline phosphatase, blood triglycerides increased

**Metabolism and nutrition disorders:** hypokalemia

**Nervous system disorders:** convulsion, dizziness

**Psychiatric disorders:** insomnia, agitation (including anxiety, panic attacks and nightmares)

**Renal and urinary disorders:** renal failure

**Respiratory, thoracic and mediastinal disorders:** dyspnea, asthma
Skin and subcutaneous tissues disorders: pruritus

Other adverse drug reactions reported in complicated skin and soft tissue infection studies:

Investigations: blood creatinine increased, blood glucose increased

Blood and lymphatic system: eosinophilia

Musculo-skeletal and connective tissue disorders: muscle spasms

Nervous system disorders: somnolence

Respiratory, thoracic and mediastinal disorders: pharyngolaryngeal pain

DRUG INTERACTIONS

Overview

In vitro studies have been carried out to investigate potential interactions at the level of CYP enzymes. However, as the concentrations of ceftobiprole used in these studies were limited by solubility, the potential for CYP drug interactions cannot be ruled out.
In vitro studies showed that ceftobiprole inhibits OATP1B1 and OATP1B3 with IC$_{50}$s of 67.6 μM and 44.1 μM, respectively. ZEVTERA may increase concentrations of drugs eliminated by OATP1B1 and OATP1B3, such as statins (pitavastin, pravastatin, rosuvastatin), glyburide, and bosentan.

**Drug-drug interactions**

No clinical interaction studies have been performed. Caution is advised when ZEVTERA is administered together with drugs with narrow therapeutic index.

**Drug-food interactions**

Interactions with food have not been established.

**Drug-herb interactions**

Interactions with herbal products have not been established.

**Drug-laboratory interactions**

**Direct antiglobulin test (Coombs test) seroconversion and potential risk of hemolytic anemia:**
The development of a positive direct antiglobulin test may occur during treatment with a cephalosporin. In clinical studies there was no evidence of hemolytic anemia. However, the possibility that hemolytic anemia may occur in association with ZEVTERA treatment cannot be ruled out. Patients experiencing anemia during or after treatment with ZEVTERA should be investigated for this possibility.

**Potential interference with urine glucose test:** During treatment with ZEVTERA it is recommended that an enzymatic method to detect glucosuria be used, because of potential interference with tests using the copper reduction technique.

**Potential interference with serum creatinine test:** It is not known whether ceftobiprole, like some other cephalosprins, interferes with the alkaline picrate assay to measure serum creatinine (Jaffé reaction), which may lead to erroneously high creatinine measurements. During treatment with ZEVTERA it is recommended that an enzymatic method of measuring serum creatinine be used.

**DOSAGE AND ADMINISTRATION**

**Dosing considerations**
The recommended dose of ZEVTERA is 500 mg administered as a 2-hour intravenous infusion every 8 hours. The usual treatment duration is 4–14 days for CAP, and 7–14 days for HAP, depending on disease severity and the patient’s clinical response. For CAP, a switch to an appropriate oral antibiotic may be considered after completion of at least 3 days of intravenous ceftobiprole medocaril sodium treatment, depending on the patient’s clinical response.
**Recommended dose and dosage adjustment**

**Renal impairment**

In patients with mild renal impairment (i.e., creatinine clearance [CL\textsubscript{CR}] 50 to 80 mL/min), no dosage adjustment is necessary. In patients with moderate renal impairment (CL\textsubscript{CR} 30 to < 50 mL/min), the recommended dose of ZEVTERA is 500 mg administered every 12 hours as a 2-hour intravenous infusion. In patients with severe renal impairment (CL\textsubscript{CR} < 30 mL/min), the recommended dose of ZEVTERA is 250 mg administered every 12 hours as a 2-hour intravenous infusion. Due to limited clinical data and an expected increased exposure of ZEVTERA and its metabolite, ZEVTERA should be used with caution in patients with severe renal impairment.

**End-stage renal disease requiring dialysis**

Ceftobiprole medocaril sodium is hemodialysable. The recommended dose for patients with end-stage renal disease with or without intermittent hemodialysis is 250 mg administered as a 2-hour intravenous infusion once every 24 hours.

**Patients with creatinine clearance > 150 mL/min**

At start of treatment the prescribing physician should assess the renal function of the patient based on creatinine clearance expressed in mL/minute.

In patients with a supra-normal creatinine clearance (> 150 mL/min), based on pharmacokinetic/pharmacodynamic considerations, prolongation of the infusion duration to 4 hours is recommended.

**Hepatic impairment**

There is no experience in patients with hepatic impairment. However, as ceftobiprole undergoes minimal hepatic metabolism and is eliminated predominantly by the kidneys, no dosage adjustment is considered necessary in patients with hepatic impairment.

**Administration**

ZEVTERA must be reconstituted and then further diluted prior to administration by intravenous infusion over a period of 2 hours.

Precipitation can occur when ZEVTERA is mixed with calcium-containing solutions in the same intravenous administration line. Therefore, ZEVTERA and calcium-containing solutions, except Lactated Ringer’s solution for injection, must not be mixed or administered simultaneously in the same intravenous line.

**Step 1. Reconstitution**

**Table 3  Reconstituted Solution**

<table>
<thead>
<tr>
<th>Vial Size</th>
<th>Volume of diluent to be added to vial</th>
<th>Approximate available volume</th>
<th>Nominal concentration per mL</th>
</tr>
</thead>
<tbody>
<tr>
<td>20 mL</td>
<td>10 mL</td>
<td>10.6 mL</td>
<td>50 mg/mL ceftobiprole</td>
</tr>
</tbody>
</table>
10 mL of sterile water for injections or dextrose 50 mg/mL (5%) solution for injection should be added to the vial and the vial should be shaken vigorously until complete dissolution, which in some cases may take up to 10 minutes. The volume of the resulting concentrate is approximately 10.6 mL. Any foam should be allowed to dissipate and the reconstituted solution should be inspected visually to ensure the product is in solution and particulate matter is absent. The reconstituted concentrate contains 50 mg/mL of ceftobiprole and must be further diluted prior to administration. It is recommended that the reconstituted solution be further diluted immediately. However, if this is not possible the reconstituted solution can be stored at room temperature for up to one hour, or in a refrigerator for up to 24 hours.

Step 2. Dilution

Preparation of 500 mg dose of ZEVTERA solution for infusion

10 mL of the reconstituted solution should be withdrawn from the vial and injected into a suitable container (e.g. PVC or PE infusion bags, glass bottles) containing 250 mL of sodium chloride 9 mg/mL (0.9%) solution for injection, dextrose 50 mg/mL (5%) solution for injection, or Lactated Ringer’s solution for injection. The infusion solution should be gently inverted 5–10 times to form a homogenous solution. Vigorous agitation should be avoided to prevent foaming. The entire contents of the infusion bag should be infused to administer a 500 mg dose of ZEVTERA.

Preparation of 250 mg dose of ZEVTERA solution for infusion for patients with severe renal impairment

Five mL of the reconstituted solution should be withdrawn from the vial and injected into a suitable container (e.g. PVC or PE infusion bags, glass bottles) containing 125 mL of sodium chloride 9 mg/mL (0.9%) solution for injection, dextrose 50 mg/mL (5%) solution for injection, or Lactated Ringer’s solution for injection. The infusion solution should be gently inverted 5–10 times to form a homogenous solution. Vigorous agitation should be avoided to prevent foaming. The entire contents of the infusion bag should be infused to administer a 250 mg dose of ZEVTERA.

The solution for infusion should be clear to slightly opalescent and yellowish in colour. The solution for infusion should be inspected visually for particulate matter prior to administration, and discarded if particulate matter is visible.

Disposal

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

OVERDOSAGE

Information on overdosage with ZEVTERA in humans is not available. The highest total daily dose administered in Phase 1 trials was 3 g (1 g every 8 hours). If overdosage should occur, it should be treated symptomatically. Ceftobiprole plasma concentrations can be reduced by hemodialysis.
ACTION AND CLINICAL PHARMACOLOGY

Mechanism of action
Ceftobiprole exerts bactericidal activity through binding to important penicillin-binding proteins (PBPs) in susceptible species. In Gram-positive bacteria, including methicillin-resistant Staphylococcus aureus (MRSA), Ceftobiprole binds to PBP2a. Ceftobiprole has demonstrated in vitro activity against strains with divergent mecA homologues (mecC or mecALGA251).

Ceftobiprole also binds to PBP2b in Streptococcus pneumoniae (penicillin-intermediate), PBP2x in S. pneumoniae (penicillin resistant), and to PBP5 in Enterococcus faecalis.

Pharmacodynamics
The effect of ceftobiprole on healthy subjects was evaluated in a QT/QTc study. Ceftobiprole had no effect on heart rate or other ECG parameters in healthy adults after administration of single intravenous therapeutic (500 mg) and supratherapeutic doses (1000 mg).

Convulsions were observed after direct administration into the brain in mice and may be attributed to inhibition of GABA receptor-mediated neurotransmission.

Pharmacokinetics

Plasma concentrations
The mean pharmacokinetic parameters of ZEVTERA in adults for a single 500 mg dose administered as a 2-hour infusion and multiple 500 mg doses administered every 8 hours as 2-hour infusions are summarized in Table 4. Pharmacokinetic characteristics were similar with single and multiple dose administration in healthy adult subjects.

Absorption
ZEVTERA is administered intravenously and therefore has 100% bioavailability.
Distribution

Ceftobiprole binds minimally (16%) to plasma proteins and binding is independent of concentration. Ceftobiprole steady-state volume of distribution (18 liters) approximates extracellular fluid volume in humans.

Metabolism

The active substance of ZEVTERA is ceftobiprole medocaril sodium, which is the pro-drug of the active moiety ceftobiprole. Conversion from the prodrug ceftobiprole medocaril sodium, to the active moiety ceftobiprole, occurs rapidly and is mediated by non-specific plasma esterases. Prodrug concentrations are negligible and are measurable in plasma and urine only during infusion. The metabolite resulting from the cleavage of the prodrug is diacetyl which is an endogenous human compound.

Ceftobiprole undergoes minimal metabolism to the open-ring metabolite, which is microbiologically inactive. Systemic exposure of the open-ring metabolite was considerably lower than for ceftobiprole, accounting for approximately 4% of the parent exposure in subject with a normal renal function.

*In vitro* studies demonstrated that ceftobiprole is an inhibitor of the hepatocyte uptake transporters OATP1B1 and OATP1B3, but is not an inhibitor of PgP, BCRP, MDR1, MRP2, OAT1, OAT3, OCT1 or OCT2. Ceftobiprole is potentially a weak substrate of the renal tubule cells uptake transporters OAT1 and OCT2.

Ceftobiprole protein binding is low (16%) and is not a PgP inhibitor or substrate. The potential for other drugs to interact with ceftobiprole is minimal, since only a small fraction of ceftobiprole is metabolized. Therefore, no relevant drug-drug interactions are anticipated.

Since ceftobiprole does not undergo tubular secretion and only a fraction is reabsorbed, renal drug-drug interactions are not expected.

Excretion

Ceftobiprole is eliminated primarily unchanged by renal excretion, with a half-life of approximately 3 hours. The predominant mechanism responsible for elimination is glomerular filtration, with some active reabsorption. Following single dose administration in human, approximately 89% of the administered dose is recovered in the urine as active ceftobiprole (83%), the open-ring metabolite (5%) and ceftobiprole medocaril (<1%).

Ceftobiprole exhibits linear and time-independent pharmacokinetics. The $C_{\text{max}}$ and AUC of ZEVTERA increase in proportion to dose over a range of 125 mg to 1 g. Steady-state active substance concentrations are attained on the first day of dosing; no appreciable accumulation occurs with every-8-hour dosing in subjects with normal renal function.

Special populations and conditions

**Pediatrics:** Only limited pharmacokinetic data of ceftobiprole are available in patients below 18 years.
**Geriatrics:** Population pharmacokinetic data showed that age as an independent parameter has no effect on the pharmacokinetics of ceftobiprole. Dosage adjustment is not considered necessary in elderly patients with normal renal function (see DOSAGE AND ADMINISTRATION, Recommended dose and dosage adjustment, Renal impairment).

**Gender:** Systemic exposure to ceftobiprole was higher in females than males (21% for C\text{max} and 15% for AUC), however the \%T>MIC was similar in both males and females. Therefore, dosage adjustments based on gender are not considered necessary.

**Race:** Population pharmacokinetic analyses (including Caucasians, Black and Other groups) and a dedicated pharmacokinetic study in healthy Japanese subjects showed no effect of race on the pharmacokinetics of ceftobiprole. Therefore, dosage adjustments based on race are not considered necessary.

**Hepatic insufficiency:** The pharmacokinetics of ceftobiprole in patients with hepatic impairment have not been established. As ceftobiprole undergoes minimal hepatic metabolism and is predominantly excreted unchanged in the urine, the clearance of ZEVTERA is not expected to be affected by hepatic impairment.

**Renal insufficiency:** The estimation of creatinine clearance should be based on the Cockcroft-Gault formula using actual body weight. During treatment with ceftobiprole it is recommended that an enzymatic method of measuring serum creatinine be used.

The pharmacokinetics of ceftobiprole are similar in healthy volunteers and subjects with mild renal impairment (CL\text{CR} 50 to 80 mL/min). Ceftobiprole AUC was 2.5- and 3.3-fold higher in subjects with moderate (CL\text{CR} 30 to < 50 mL/min) and severe (CL\text{CR} < 30 mL/min) renal impairment, respectively, than in healthy subjects with normal renal function. Dosage adjustment is recommended in patients with moderate to severe renal impairment (see DOSAGE AND ADMINISTRATION, Recommended dose and dosage adjustment, Renal impairment).

**End-stage renal disease requiring dialysis**

AUCs of ceftobiprole and of the microbiologically inactive ring-opened metabolite are substantially increased in patients with end stage renal disease who require hemodialysis compared with healthy subjects. In a study where six subjects with end stage renal disease on hemodialysis received a single dose of 250 mg ZEVTERA by intravenous infusion, ceftobiprole was demonstrated hemodialysable with an extraction ratio of 0.7.

Patients with creatinine clearance > 150mL/min

Ceftobiprole systemic clearance (CL\text{SS}) was 40% greater in subjects with a CL\text{CR} > 150 mL/min compared to subjects with a normal renal function (CL\text{CR} = 80-150 mL/min). Volume of distribution was 30% larger. In this population, based on pharmacokinetic/pharmacodynamic considerations, prolongation of duration of infusion is recommended.

**Body weight:** A study was performed in morbidly obese subjects. No dose adjustments based on body weight are required.
**PK/PD relationship**

As with other beta-lactam antimicrobial agents, the percentage of time above the minimum inhibitory concentration (MIC) of the infecting organism over the dosing interval (%T > MIC) has been shown to be the parameter that best correlates with the efficacy of ceftobiprole.

**STORAGE AND STABILITY**

**Storage of vials:**

Vials should be stored under refrigeration (2 °C – 8 °C) in the carton in order to protect from light prior to constitution and should be kept in a safe place out of reach and sight of children.

**Shelf life**

*Powder vial*

3 years

*After reconstitution*

Chemical, and physical in-use stability of the reconstituted solution (50 mg/mL) has been demonstrated for 1 hour at 25 °C and up to 24 hours at 2 °C – 8 °C.

*After dilution*

Chemical, and physical in-use stability data support the total times for reconstitution and infusion (2.67 mg/mL) described in Table 5.

**Table 5 Total time by which reconstitution and infusion (including a 2-hour period of infusion) must be completed**

* Do not expose to direct sunlight

**SPECIAL HANDLING INSTRUCTIONS**

Each vial is for single use only. ZEVTERA must be reconstituted and then further diluted prior to infusion (see the DOSAGE AND ADMINISTRATION section).
From a microbiological point of view, unless the method of reconstitution/dilution precludes the risk of microbiological contamination, the product should be used immediately. If not used immediately, in-use storage times and conditions prior to use are the responsibility of the user. The reconstituted and infusion solutions should not be frozen or exposed to direct sunlight.

If the infusion solution is stored in the refrigerator, it should be equilibrated to room temperature prior to administration. The infusion solution does not need to be protected from light during administration. The infusion solution should be prepared and used as defined in DOSAGE AND ADMINISTRATION section.

For storage conditions of the reconstituted and/or diluted medicinal product, see the STORAGE AND STABILITY section.

**DOSAGE FORMS, COMPOSITION AND PACKAGING**

Each vial contains 500 mg of ceftobiprole (as 666.6 mg of ceftobiprole medocaril sodium). After reconstitution, each mL of concentrate contains 50 mg of ceftobiprole (as 66.7 mg of ceftobiprole medocaril sodium).

**Excipients with known effect**

Each vial of ZEVTERA contains approximately 1.3 mmol (29 mg) of sodium. The excipients are citric acid monohydrate and sodium hydroxide.

**Pharmaceutical Form**

ZEVTERA powder for concentrate for solution for infusion is white, yellowish to slightly brownish, cake to broken cake or powder. The pH of the reconstituted solution is between 4.5 and 5.5.

**Nature and contents of container**

ZEVTERA is supplied as 20 mL clear type I glass vials fitted with a grey bromobutyl elastomeric closure and an aluminum seal with a blue plastic flip-off cap.

A carton contains 10 vials.
PART II: SCIENTIFIC INFORMATION

PHARMACEUTICAL INFORMATION

Drug substance

Proper name: ceftobiprole medocaril

Chemical name: The chemical name for ceftobiprole medocaril (BAL5788) is \((6R,7R)-7-\left[(2Z)-2-(5\text{-amino}-1,2,4\text{-thiadiazol}-3\text{-yl})-2-\text{(hydroxyimino)}acetyl\right]\text{amino}\}-3-\left[(E)-(3'\text{R})-1'-\left[(5\text{-methyl}-2\text{-oxo}-1,3\text{-dioxol}-4\text{-yl})\text{methoxy}\right]\text{carbonyl}\right]-2\text{-oxo}[1,3'\text{-bipyrrrolidin}\right]-3\text{-ylidene}]\text{methyl}\right]-8\text{-oxo}-5\text{-thia}-1\text{-azabicyclo}[4.2.0]\text{oct}-2\text{-ene}-2\text{-carboxylic acid, monosodium salt.}

The chemical name for the active principle ceftobiprole (BAL9141) is \((6R,7R)-7-\left[(2Z)-2-(5\text{-amino}-1,2,4\text{-thiadiazol}-3\text{-yl})-2-\text{(hydroxyimino)}acetyl\right]\text{amino}\}-3-\left[(E)-(3'\text{R})-2\text{-oxo}[1,3'\text{-bipyrrrolidin}]\right]-3\text{-ylidene}]\text{methyl}\right]-8\text{-oxo}-5\text{-thia}-1\text{-azabicyclo}[4.2.0]\text{oct}-2\text{-ene}-2\text{-carboxylic acid.}

Molecular formula and molecular mass: The molecular formula for the active principle of ceftobiprole (BAL9141) is \(C_{20}H_{22}N_8O_6S_2\). The molecular weight for the active principle, ceftobiprole (BAL9141) is 534.57.

The molecular formula for the prodrug, ceftobiprole medocaril (BAL5788) is \(C_{26}H_{25}N_8NaO_{11}S_2\). The molecular weight for the prodrug, ceftobiprole medocaril (BAL5788) is 712.64.

Structural formula: Cefitobiprole medocaril prodrug (BAL5788):

Cefitobiprole active principle (BAL9141):

Physicochemical properties: The prodrug ceftobiprole medocaril (BAL5788) is a water soluble amorphous, yellowish powder. Cefitobiprole medocaril sodium 667 mg corresponds to 500 mg of the active principle ceftobiprole (BAL9141). It is provided as a sterile lyophilized powder that must be constituted and diluted in an appropriate diluent before administration via intravenous infusion. Inactive ingredients are citric acid monohydrate and sodium hydroxide.
Product characteristics

Ceftobiprole medocaril powder for concentrate for solution for infusion is manufactured by sterile filtration of the ceftobiprole bulk solution and aseptic filling into depyrogenated glass vials. The subsequent lyophilization process results in the final drug product.

CLINICAL TRIALS

Study demographics and study design

Hospital acquired pneumonia (HAP)

Study BAP248/307 was a randomized, double-blind, multicenter study of ceftobiprole versus linezolid plus ceftazidime investigating the efficacy and safety of ceftobiprole in subjects with nosocomial pneumonia, including a subset (27%) of patients with VAP.

Study populations

The percentage of male subjects in the ceftobiprole group was 71% and 62% in the comparator group. The percentage of subjects who were aged ≥ 65 years was 46.9% and the racial composition of the study populations the percentage of Asian subjects was 12.2% and the percentage of ‘other’ subjects (i.e., not white, black, or Asian) was 3.6%

Study results

The study achieved its primary objective of demonstrating non-inferiority of ceftobiprole compared with ceftazidime plus linezolid for clinical cure rate at the TOC visit. For the secondary efficacy endpoints the outcome for the ceftobiprole and comparator group was similar.

For subjects with HAP (excluding VAP), clinical cure rates were comparable between treatment groups: 154/198 (77.8%) in the ceftobiprole group, and 141/185 (76.2%) in the comparator group. The clinical cure rates in VAP subjects were 20/53 (37.7%) in the ceftobiprole group and 33/59 (55.9%) in the comparator group. The results were similar in the ITT and CE analysis sets.

Community-acquired pneumonia (CAP)

Study CAP 3001 was a randomized, double-blind, multicentre study of ceftobiprole versus ceftriaxone with or without linezolid, designed to assess the efficacy and safety of ceftobiprole in adult subjects with CAP requiring hospitalization. A switch from intravenous study drugs to oral therapy (oral cefuroxime axetil; 500 mg every 12 hours) was allowed, after a minimum of 3 days of intravenous therapy, for subjects who met protocol-specified criteria for early improvement and who were candidates for hospital discharge.

**Study population**

Patients in Study CAP 3001 must have had a diagnosis of pneumonia acquired in the community and severe enough to require hospitalization and treatment with intravenous antibiotics for at least 3 days. The percentage of subjects who were aged ≥ 65 years was 35.5%; and the percentage of Asian subjects was 21.0% and the percentage of ‘other’ subjects (i.e., not white, black, or Asian) was 14.2%.

MICROBIOLOGY

Mechanism of Action

Ceftobiprole exerts \textit{in vitro} bactericidal activity over a broad range of pathogens, including both Gram-positive and Gram-negative bacteria, due to its binding to important penicillin-binding proteins (PBPs) such as PBP2a, that confers β-lactam resistance in staphylococci. Ceftobiprole is resistant to hydrolysis by the \textit{S. aureus} PC1 Class A β-lactamase, and is relatively resistant to hydrolysis by many β-lactamases of Class C and Class A Gram-negative bacteria. Like the extended-spectrum cephalosporins, ceftobiprole is hydrolyzed by extended-spectrum β-lactamases (ESBLs) and metallo-β-lactamases. The minimum concentration at which 90% of tested strains are inhibited (MIC$_{90}$) against methicillin resistant staphylococci is ≤ 4 µg/mL (MIC range: 0.12 to 8.0 µg/mL), including MRSA from the major epidemic clones. Ceftobiprole has a similar spectrum of activity as cefepime and ceftazidime against \textit{P. aeruginosa} and other Gram-negative organisms. Stable or high-level resistance selection in staphylococci and pneumococci and \textit{Haemophilus influenzae} has been difficult to select \textit{in vitro}.

Mechanism of resistance

Ceftobiprole is inactive against strains of Enterobacteriaceae that express Ambler class A β-lactamases, especially TEM, SHV and CTX-M type extended-spectrum β-lactamases (ESBL) and the KPC-type carbapenemases, Ambler class B β-lactamases and Ambler class D β-lactamases, especially ESBL variants and carbapenemases (OXA-48). Ceftobiprole is also inactive against strains that have high levels of expression of Ambler class C β-lactamases.

Ceftobiprole is inactive against strains of \textit{P. aeruginosa} that express enzymes belonging to Ambler class A (e.g., PSE-1), Ambler class B (e.g., IMP-1, VIM-1, VIM-2) and Ambler class D (e.g., OXA-10). It is also inactive against isolates that have acquired mutations in regulatory genes leading to de-repressed levels of expression of the chromosomal Ambler class C β-lactamase, or over-expression of the Mex XY efflux pump.

Ceftobiprole is inactive against strains of \textit{Acinetobacter spp.} that express enzymes belonging to Ambler class A (e.g., VEB-1), Ambler class B (e.g., IMP-1, IMP-4) Ambler class D (e.g., OXA 25, OXA-26), or that have de-repressed levels of expression of the chromosomal Ambler class C β-lactamase.

List of Microorganisms

Clinical efficacy against specific pathogens

Ceftobiprole has been shown to be active against the following bacteria, both in vitro and in clinical infections (see \textbf{INDICATIONS AND CLINICAL USE})

\textit{Hospital-acquired pneumonia (HAP), excluding VAP}

\begin{itemize}
  \item \textit{Staphylococcus aureus} (including MRSA)
  \item \textit{Streptococcus pneumoniae}
  \item \textit{Escherichia coli}
  \item \textit{Klebsiella pneumoniae}
\end{itemize}
**Community-acquired pneumonia (CAP)**

- *Staphylococcus aureus* (including MRSA)
- *Streptococcus pneumoniae*
- *Escherichia coli*
- *Klebsiella pneumoniae*
- *Haemophilus influenzae*

**Antibacterial activity against other relevant pathogens**

The following *in vitro* data are available, but their clinical significance is has not been established. *In vitro* studies suggest that they would be susceptible to ceftobiprole in the absence of acquired mechanisms of resistance. The safety and effectiveness of ceftobiprole in treating clinical infections due to these bacteria have not been established in adequate and well-controlled clinical trials.

- *Acinetobacter spp.*
- *Citrobacter spp.*
- *Enterobacter spp.*
- *Klebsiella oxytoca*
- *Moraxella catarrhalis*
- *Morganella morgani*
- *Proteus mirabilis*
- *Providencia spp.*
- *Pseudomonas spp.*
- *Serratia spp.*

*In vitro* data indicate that the following species are not susceptible to ceftobiprole:

- *Chlamyophila (Chlamydia) pneumoniae*
- *Burkholderia cepacia complex*
- *Mycoplasma pneumoniae*
- *Mycobacteria*
- *Norcardia spp.*
- *Stenotrophomonas maltophilia*

**Susceptibility Test Methods**

When available, the results of *in vitro* susceptibility test results for antimicrobial drugs used in the local hospitals and practice areas should be provided to the physician as periodic reports that describe the susceptibility profile of nosocomial and community-acquired pathogens. These reports should aid the physician in selecting an antibacterial drug for treatment.

**Dilution Techniques**

Quantitative methods are used to determine antimicrobial MICs. These MICs provide estimates of the susceptibility of bacteria to antimicrobial compounds. The MICs should be determined using a standardized test method (broth, and/or agar). The MIC values should be interpreted according to the criteria in Table 12:
Table 12  Dilution susceptibility interpretive criteria for ceftobiprole

<table>

</tbody>
</table>

**Diffusion Techniques**

On the basis of regression analyses of antibacterial susceptibility disks loaded with different quantities of ceftobiprole, a ceftobiprole content of 30 µg per disk appeared optimal for disk diffusion studies.

A report of “Susceptible” indicates that the antimicrobial is likely to inhibit growth of the pathogen if the antimicrobial compound reaches the concentration at the infection site necessary to inhibit growth of the pathogen. A report of “Intermediate” indicates that the result should be considered equivocal, and if the microorganism is not fully susceptible to alternative clinically feasible drugs, the test should be repeated. This category implies possible clinical applicability in body sites where the drug is physiologically concentrated. This category also provides a buffer zone that prevents small uncontrolled technical factors from causing major discrepancies in interpretation. A report of “Resistant” indicates that the antimicrobial is not likely to inhibit growth of the pathogen if the antimicrobial compound reaches the concentrations usually achievable at the infection site; other therapy should be selected.

**Quality Control**

Standardized susceptibility test procedures require the use of laboratory controls to monitor and ensure the accuracy and precision of supplies and reagents used in the assay, and the techniques of the individuals performing the test.

Quality Control ranges for the MIC and disk diffusion zone diameters for the CLSI quality control strains tested are presented in the table below. These ranges were approved by CLSI in June 2005. The data show that the 7 to 9 mm zone diameter ranges for ceftobiprole disk diffusion tests encompass at least 95% of the reported results. Similarly, the 3 to 4 log₂ dilution ranges for ceftobiprole MIC results encompass almost 100% of the reported results.

Table 13  CLSI-approved QC ranges for ceftobiprole using CLSI MIC and disk diffusion methods

TOXICOLOGY

The toxicology program supporting ceftobiprole medocaril (BAL5788) is outlined below.

Systemic toxicity

Repeated dose studies by intravenous infusion were conducted in the rat (4-week), marmoset (4-week) and dog (2-week). In the rat, daily doses of up to 360 mg/kg/day, given over 4 hours, resulted in minimal to slight cytoplasmic inclusions in the renal proximal tubules (≥250mg/kg/day) which were not associated with any functional changes and were reversible after 4-weeks without treatment. In this study, the no observed adverse effect level (NOAEL) was 360 mg/kg/day (12 × the clinical dose). In the marmoset, daily doses of up to 200 mg/kg/day, given over 4 hours, resulted in slightly increased blood urea nitrogen (BUN) levels and a minimal occurrence of brown pigment in the distal tubular epithelium of the kidneys (200 mg/kg/day), both of which were reversible after 4 weeks without treatment. In the marmoset, the NOAEL was 100 mg/kg/day (3 × the clinical dose). In the dog, daily doses of up to 100 mg/kg/day were given over 30 minutes on Day 1, but were associated with a slight histaminergic reaction, which was attenuated from Day 2 by increasing the infusion duration from to 2 hours. At the end of treatment, eosinophilic droplets were observed in the proximal tubule epithelium of the kidney at ≥ 50 mg/kg/day. In the dog, no NOAEL was established due to slight histaminergic reactions observed at ≥25 mg/kg/day (the lowest dose given).

Subsequent 13-week studies were conducted in the rat, marmoset and dogs by intravenous infusion. In rats, mortality was observed at doses ≥ 250 mg/kg/day due to renal toxicity, characterized by precipitation of drug-like material in the distal part of the nephron, which at lower doses was partially reversible after 4 weeks without treatment. In the rat, the NOAEL was 125 mg/kg/day (4 × the clinical dose). In marmosets, vomiting and reversible renal proximal tubule pigmentation were observed at ≥ 100 mg/kg/day, as well as increases in plasma AST and LDH at 200 mg/kg/day. In the marmoset, NOAELs of 100 and 50 mg/kg/day were established for males and females, respectively (3.3 × and 1.7 × the clinical dose, respectively). In the dog, daily doses of 8 and 32 mg/kg/day were given, although at 32 mg/kg/day the cannula did not remain patent due to infusion site reactions, resulting in the sacrifice of 5/6 dogs, 4 to 11 weeks into the study. There were no additional findings of toxicological importance in these animals. At 8 and 32 mg/kg/day, clinical observations included discoloured urine and a reddening of the skin and mucous membranes (attributed to histamine release). In the dog, the NOAEL was 8 mg/kg/day (approximately 75% less than the clinical dose).

Carcinogenicity

No lifetime studies in animals have been conducted to evaluate the carcinogenic potential of ceftobiprole.

Mutagenicity/genotoxicity

The genotoxic potential of the pro-drug ceftobiprole medocaril and its active component ceftobiprole (BAL9141) were examined in vitro and in vivo.

Ceftobiprole medocaril exhibited clastogenic activity in the ML/TK assay at 750 and 500 μg/mL (cytotoxic concentrations) with and without metabolic activation, respectively, and at 150 μg/mL without metabolic activation, whereas ceftobiprole induced an equivocal effect at 2000 μg/mL. In the HCA assay, ceftobiprole medocaril (but not ceftobiprole) was clastogenic at cytotoxic
concentrations, which is considered attributable to the cleavage product diacetyl. No genotoxic activity was seen with ceftobiprole medocaril in vivo at ≤ 500 mg/kg/day in the CHO/HPRT assay, the in vivo micronucleus assay in mouse bone marrow, or in an unscheduled DNA synthesis (UDS) assay.

Based on these observations, a genotoxic liability of ceftobiprole medocaril in humans is considered not likely.

**Teratogenicity / impairment of fertility**

Ceftobiprole medocaril was neither teratogenic nor embryotoxic in rats and cynomolgus monkeys after i.v. infusion of doses up to 360 mg/kg/day (4 h) and 120 mg/kg/day (2 h), respectively, and had no effects on fertility or early embryonic development in rats after i.v. infusion of doses up to 360 mg/kg/day (4 h). In cynomolgus monkeys, reduced litter size and survival rate were observed at doses that cause maternal toxicity. Studies in rats have shown that the concentration of ceftobiprole excreted in animal milk is 20% of the maternal plasma levels. In a pre- and postnatal toxicity study in rats administered ceftobiprole medocaril via i.v. infusion (4 h), the NOAEL in dams (F0 generation) was 175 mg/kg (a 6 × multiple of the clinical dose) for maternal toxicity, and 250 mg/kg/day (an 8 × multiple of the clinical dose) for reproductive toxicity. Functional and physical development of the F1 and F2 generations were normal in all groups.

**Juvenile toxicity**

BAL5788 was tested for its effects on juvenile rats (dosing start on Day 1 post-partum) by daily subcutaneous administration for 50 days. Signs of toxicity (e.g., altered activity patterns, increased muscle tone, coordination impairment and retardation of development) were limited to the highest dose (250 mg/kg) and these findings were either fully or partially reversible after a 4-week recovery period. The NOAEL was 100 mg/kg/day. Toxicokinetic investigations showed a decreased \( T_{1/2} \) as the dosing progressed, a decrease in exposure, and an increase in renal clearance.

**Other studies**

Infusion site reactions were observed in the 13-week studies in rats and primates. These infusion site reactions were attributable to the physical irritation of the veins by the catheter, the obstruction to the blood flow, and the presence of fibrinous material, all predisposing the veins to irritation from the compound, which ultimately resulted in thrombus formation and the release of emboli. The observed mortality in these studies was attributed to thrombo-embolic changes, which were observed at ≥ 250 mg/kg/day in rats, and in marmosets at ≥ 50 mg/kg/day, where it was preceded by convulsions and a general decline in physical condition.

The potential for antigenicity was observed in guinea pigs after intravenous bolus doses ≥ 20 mg/kg and subcutaneous doses of 50 mg/kg when given in combination with adjuvant, and in dogs as evidenced by the histaminergic response observed in the 2 and 13 week studies.

No hemolysis or precipitation was observed in vitro with dog plasma at concentrations ≤ 12.5 mg/mL, although in human, rat and marmoset, plasma turbidity and precipitation were observed at ≥ 12.5 mg/mL.
In local irritation studies in male rabbits, single doses resulted in minimally more irritation compared to saline when given at \( \geq 2 \text{ mg/mL} \) peri-vascularly, and at 10 mg/mL when given subcutaneously or intramuscularly. There were no effects after inter-arterial administration.

No cephalosporin-specific nephrotoxicity was observed in rabbits, and no phototoxicity was observed \textit{in vitro} (ceftobiprole) or \textit{in vivo} in rats.

READ THIS FOR SAFE AND EFFECTIVE USE OF YOUR MEDICINE

PATIENT MEDICATION INFORMATION

Pr ZERVETERA®
Ceftobiprole medocaril powder for injection

Read this carefully before you start taking ZERVETERA and each time you get a refill. This leaflet is a summary and will not tell you everything about this drug. Talk to your healthcare professional about your medical condition and treatment and ask if there is any new information about ZERVETERA.

**Serious Warnings and Precautions**

Serious and occasionally fatal allergic (hypersensitivity) reactions have been reported in patients receiving β-lactam antibiotics (same class as ZERVETERA). Allergic reactions have also been observed with ZERVETERA use. Talk to your doctor if you have had any previous allergic reactions to penicillins, cephalosporins or other allergens (See What are possible side effects from using ZERVETERA).

**What is ZERVETERA used for?**

ZERVETERA is used for the treatment of bacterial infections. Your doctor prescribed ZERVETERA because you have a serious lung infection referred to as Hospital-acquired pneumonia (HAP) or Community-acquired pneumonia (CAP).

Antibacterial drugs, including ZERVETERA, should only be used to treat bacterial infection. They do not treat viral infections (e.g. the common cold). Your doctor will make this decision. Although it is common to feel better early in the course of antibacterial therapy, the medication should be taken exactly as directed and should not be shared. Misuse or overuse of ZERVETERA could lead to the growth of bacteria that will not be killed by ZERVETERA (resistance). This means that ZERVETERA may not work for you in the future. Do not share your medicine.

**How does ZERVETERA work?**

ZERVETERA is an antibiotic medicine containing the active substance ceftobiprole, which belongs to an established group of medicines called ‘cephalosporin antibiotics’. ZERVETERA works by killing certain bacteria which can cause serious lung infections, including those which have developed resistance to other drugs.

**What are the ingredients in ZERVETERA?**

Medicinal ingredients: ceftobiprole medocaril sodium
Non-medicinal ingredients: citric acid monohydrate, sodium hydroxide
ZEVTERA comes in the following dosage forms:
ZEVTERA comes as a powder in clear glass vials, each vial containing 500 mg of the active substance ceftobiprole. The powder is made up into a concentrate by a doctor or nurse, then diluted for intravenous administration.

Do not use ZEVTERA if:
- you are hypersensitive (allergic) to ZEVTERA or to citric acid monohydrate or sodium hydroxide.
- you are hypersensitive to cephalosporin antibiotics.
- you have immediate and severe hypersensitivity (e.g., an anaphylactic (severe allergic) reaction) to any other type of beta-lactam antibiotic, such as penicillins or carbapenems.

To help avoid side effects and ensure proper use, talk to your healthcare professional before you take ZEVTERA. Talk about any health conditions or problems you may have, including if you:
- have other infections. While antibiotics including ZEVTERA kill certain bacteria, other bacteria and fungi may continue to grow more than normal. This is called overgrowth. Your doctor will monitor you for overgrowth and treat you if necessary.
- are pregnant or planning to become pregnant.
- have kidney problems.
- are breast-feeding or if you intend to breast-feed.
- are taking or have recently taken any other medicines, including medicines you get without a prescription.
- are under 18 years of age. ZEVTERA should not be given to children or adolescents as there is no experience with the use of ZEVTERA in children.
- have any allergies to any medicines, including antibiotics.
- are on a controlled sodium diet.
- have diarrhea during after being given ZEVTERA.
- have a history of severe hypersensitivity reactions to antibiotics.
- have a history of seizures.
- are HIV positive.
- have a severely weakened immune system.
- have very low white blood counts.
- have a lowered bone marrow function.

Tell your healthcare professional about all the medicines you take, including any drugs, vitamins, minerals, natural supplements or alternative medicines.

The following may interact with ZEVTERA:
- statins (pitavastin, pravastatin, rosvastatin), glyburide, and bosentan

How to take ZEVTERA:
ZEVTERA will be given to you by a doctor or nurse.
Usual adult dose:
The pharmacist or healthcare professional will prepare the product for use.

The recommended dose is 500 mg ceftobiprole every 8 hours given as a drip into a vein over a period of 2 hours. Treatment usually lasts 4-14 days for CAP and 7-14 days for HAP. Your doctor will decide on the duration of treatment. You may need a lower dose if you have kidney problems.

Overdose:
There is no information available on overdosing of ZEVTERA.

If you think you have taken too much ZEVTERA, contact your healthcare professional, hospital emergency department or regional Poison Control Centre immediately, even if there are no symptoms.

Missed dose:
If you think you have missed a dose of ZEVTERA, discuss this with your healthcare professional as soon as possible.

What are possible side effects from using ZEVTERA?
These are not all the possible side effects you may feel when taking ZEVTERA. If you experience any side effects not listed here, contact your healthcare professional. Please also see WARNINGS AND PRECAUTIONS.

If you experience symptoms such as severe diarrhea (bloody or watery) with or without fever, abdominal pain, or tenderness, you may have Clostridium difficile colitis (bowel inflammation). If this occurs, stop taking ZEVTERA and contact your healthcare professional immediately.

The following side effects may happen with this medicine. The frequency category is based on reporting of the side effect, whether or not the side effect was caused by the drug.

Common: may affect between 1% and 10% of people
  - Headache, drowsiness (somnolence)
  - Feeling dizzy
  - Unusual taste (dysgeusia)
  - Rash, itching or hives - Contact your doctor if these symptoms persist
  - Feeling sick (nausea), being sick (vomiting) - Contact your doctor if these symptoms persist
  - Redness, pain or swelling were the injection was given - Contact your doctor if these symptoms persist

Uncommon: may affect between 0.1% and 1% of people
  - Stomach pain (abdominal pain), indigestion or “heartburn” (dyspepsia)
  - Muscle cramps

If you have a troublesome symptom or side effect that is not listed here or becomes bad enough to interfere with your daily activities, talk to your healthcare professional.
Reporting Side Effects

You can report any suspected side effects associated with the use of health products to Health Canada by:

- Visiting the Web page on Adverse Reaction Reporting (https://www.canada.ca/en/health-canada/services/drugs-health-products/medeffect-canada.html) for information on how to report online, by mail or by fax; or
- Calling toll-free at 1-866-234-2345.

NOTE: Contact your health professional if you need information about how to manage your side effects. The Canada Vigilance Program does not provide medical advice.

Storage of vials:

Keep in a safe place out of reach and sight of children.

The healthcare professional will store the product under refrigeration (2°C - 8°C) in the carton to protect from light, before reconstitution.

If you want more information about ZEVTERA:

- Talk to your healthcare professional
- Find the full product monograph that is prepared for healthcare professionals and includes this Patient Medication Information by visiting the Health Canada website; the manufacturer’s website www.avirpharma.com, or by calling 1-800-363-7988.

This information is current up to the time of the last revision date shown below, but more current information may be available from the manufacturer.
