INDICATIONS AND CLINICAL USE

Sandoz Irbesartan HCT (irbesartan/hydrochlorothiazide) is indicated:

- For the treatment of essential hypertension in patients for whom combination therapy is appropriate (see DOSAGE AND ADMINISTRATION).
- As initial therapy in patients with severe essential hypertension (Sitting DBP ≥ 110 mmHg) for whom the benefit of a prompt blood pressure reduction exceeds the risk of initiating combination therapy in these patients (see CLINICAL TRIALS and DOSAGE AND ADMINISTRATION).

Sandoz Irbesartan HCT is not indicated as initial therapy in patients with mild to moderate essential hypertension.

Geriatrics (> 65 years of age): In clinical studies, no overall differences in safety or efficacy were observed between patients > 65 years of age and younger patients (See WARNINGS AND PRECAUTIONS, Special populations).

Pediatrics (< 18 years of age): The safety and efficacy of Sandoz Irbesartan HCT in patients <18 years of age have not been established (See WARNINGS AND PRECAUTIONS, Special populations).
CONTRAINDICATIONS

Sandoz Irbesartan HCT is contraindicated in:

- Patients who are hypersensitive to this drug or to any ingredient in the formulation. For a complete listing, see the DOSAGE FORMS, COMPOSITION AND PACKAGING section of the Product Monograph.
- Patients who are hypersensitive to other sulphonamide-derived drugs, because of the hydrochlorothiazide component.
- Patients with anuria.
- Pregnant women (see WARNINGS AND PRECAUTIONS, Special Populations, Pregnant Women.)
- Nursing women (see WARNINGS AND PRECAUTIONS, Special Populations, Nursing Women.)
- Combination with aliskiren-containing drugs in patients with diabetes mellitus (type 1 or type 2) or moderate to severe renal impairment (GFR < 60 ml/min/1.73m²) (see WARNINGS AND PRECAUTIONS, Renal, Renal Impairment, and DRUG INTERACTIONS, Dual Blockade of the Renin-Angiotensin-System (RAS) with ARBs, ACE inhibitors or aliskiren-containing drugs).
- Combination with angiotensin converting enzyme (ACE) inhibitors in patients with diabetic nephropathy (see WARNINGS AND PRECAUTIONS, Renal, Renal Impairment, and DRUG INTERACTIONS, Dual Blockade of the Renin-Angiotensin-System (RAS) with ARBs, ACE inhibitors or aliskiren-containing drugs).
- Patients with rare hereditary problems of galactose intolerance, the Lapp lactase deficiency or glucose-galactose malabsorption (due to lactose component of the Sandoz Irbesartan HCT tablets).

WARNINGS AND PRECAUTIONS

Serious Warnings and Precautions

When used in pregnancy, angiotensin receptor (AT₁) blockers (ARB) can cause injury and even death of the developing fetus. When pregnancy is detected, Sandoz Irbesartan HCT should be discontinued as soon as possible (see WARNINGS AND PRECAUTIONS, Special Populations).

General

The effect of irbesartan on the ability to drive and use machinery has not been studied, but based on its pharmacodynamic properties, irbesartan is unlikely to affect this ability. When driving vehicles or operating machinery, it should be taken into account that occasionally dizziness or weariness may occur during treatment of hypertension.
Cardiovascular Hypotension:
Occasionally, symptomatic hypotension has occurred after administration of irbesartan, in some cases after the first dose. It is more likely to occur in patients who are volume depleted by diuretic therapy, dietary salt restriction, dialysis, diarrhea, or vomiting. In these patients, because of the potential fall in blood pressure, therapy should be started under close medical supervision (see DOSAGE AND ADMINISTRATION). Similar considerations apply to patients with ischemic heart or cerebrovascular disease, in whom an excessive fall in blood pressure could result in myocardial infarction or cerebrovascular accident.

Valvular Stenosis:
There is concern on theoretical grounds that patients with aortic stenosis might be at particular risk of decreased coronary perfusion when treated with vasodilators because they do not develop as much afterload reduction.

Dual Blockade of the Renin-Angiotensin System (RAS)
There is evidence that co-administration of angiotensin receptor antagonists (ARBs), such as the irbesartan, component of Sandoz Irbesartan HCT or of angiotensin converting enzyme (ACE) inhibitors with aliskiren increases the risk of hypotension, syncope, stroke, hyperkalemia and deterioration of renal function, including renal failure, in patients with diabetes mellitus (type 1 or type 2) and/or moderate to severe renal impairment (GFR < 60 ml/min/1.73m²). Therefore, the use of Sandoz Irbesartan HCT in combination with aliskiren-containing drugs is contraindicated in these patients (see CONTRAINDICATIONS).

The use of Sandoz Irbesartan HCT in combination with an ACE inhibitor is contraindicated in patients with diabetic nephropathy (see CONTRAINDICATIONS).

Further, co-administration of ARBs, including the irbesartan component of Sandoz Irbesartan HCT, with other agents blocking the RAS, such as ACE inhibitors or aliskiren-containing drugs, is generally not recommended in other patients, since such treatment has been associated with an increased incidence of severe hypotension, renal failure, and hyperkalemia.

Endocrine and Metabolism
Thiazides, including hydrochlorothiazide, can cause fluid or electrolyte imbalance (hypokalemia, hyponatremia and hypochloremic alkalosis). Periodic determination of serum electrolytes to detect possible electrolyte imbalance should be performed at appropriate intervals.

Calcium excretion is decreased by thiazides which may cause intermittent and slight elevation of serum calcium. If calcium or a calcium sparing drug (e.g., vitamin D therapy) is prescribed, serum calcium levels should be monitored and calcium dosage adjusted accordingly. Marked hypercalcemia suggests the possibility of hyperparathyroidism. Thiazides should be discontinued before carrying out tests for parathyroid function.

Thiazides have been shown to increase the urinary excretion of magnesium, which may result in hypomagnesemia.

Hyperuricemia may occur, and an acute attack of gout may be precipitated in certain
patients receiving thiazide therapy.

Insulin requirements in diabetic patients may be altered and latent diabetes mellitus may become manifest during thiazide diuretic therapy.

Increases in cholesterol and triglyceride levels may be associated with thiazide diuretic therapy.

Thiazides may decrease serum PBI levels without signs of thyroid disturbance.

**Hepatic/Biliary/Pancreatic**
Thiazides should be used with caution in patients with impaired hepatic function or progressive liver disease, since minor alterations in fluid and electrolyte balance may precipitate hepatic coma.

**Immune**

**Hypersensitivity Reaction:**
Sensitivity reactions to hydrochlorothiazide may occur in patients with or without a history of allergy or bronchial asthma.

**Systemic Lupus Erythematosus:**
Thiazide diuretics have been reported to cause exacerbation or activation of systemic lupus erythematosus.

**Ophthalmic**

**Secondary Acute Angle-Closure Glaucoma and/or Acute Myopia:**
Hydrochlorothiazide is a sulfonamide. Sulfonamide or sulfonamide derivative drugs can cause an idiosyncratic reaction, which may result in secondary acute angle-closure glaucoma and/or acute myopia (see ADVERSE REACTIONS, Post-Market Adverse Drug Reactions). Symptoms include acute onset of decreased visual acuity or ocular pain and typically occur within hours to weeks of drug initiation. Untreated acute angle-closure glaucoma can lead to permanent vision loss. The primary treatment is to discontinue drug intake as rapidly as possible. Prompt medical or surgical treatments may need to be considered if the intraocular pressure remains uncontrolled. Risk factors for developing acute angle-closure glaucoma may include a history of sulfonamide or penicillin allergy.

**Renal**

**Azotemia:**
Azotemia may be precipitated or increased by hydrochlorothiazide. Cumulative effects of the drug may develop in patients with impaired renal function.

If increasing azotemia and oliguria occur during treatment of severe progressive renal impairment the diuretic should be discontinued.

**Renal Impairment:**
As a consequence of inhibiting the renin-angiotensin-aldosterone system (RAAS), changes in renal function have been seen in susceptible individuals. In patients whose renal function may depend on the activity of the RAAS, such as patients with bilateral renal artery
stenosis, unilateral renal artery stenosis to a solitary kidney, or severe congestive heart failure, treatment with agents that inhibit this system has been associated with oliguria, progressive azotemia, and rarely, acute renal failure and/or death. In susceptible patients, concomitant diuretic use may further increase risk.

The use of ARBs – including the irbesartan component of Sandoz Irbesartan HCT or of the ACE inhibitors with aliskiren-containing drugs is contraindicated in patients with moderate to severe renal impairment (GFR < 60 ml/min/1.73m²). (See CONTRAINDICATIONS and DRUG INTERACTIONS, Dual Blockade of the Renin-Angiotensin-System (RAS) with ARBs, ACE inhibitors, or aliskiren-containing drugs).

The use of ARBs including the irbesartan component of Sandoz Irbesartan HCT in combination with an ACE inhibitor is contraindicated in patients with diabetic nephropathy due to risk of hyperkalemia, hypotension and renal impairment (see CONTRAINDICATIONS and DRUG INTERACTIONS, Dual Blockade of the Renin-Angiotensin-System (RAS)).

Use of irbesartan should include appropriate assessment of renal function.

Thiazides should be used with caution.

Because of the hydrochlorothiazide component, Sandoz Irbesartan HCT (irbesartan/hydrochlorothiazide) is not recommended in patients with severe renal impairment (creatinine clearance ≤ 30 mL/min).

Skin
The use of Sandoz Irbesartan HCT in patients with psoriasis or a history of psoriasis should be carefully weighed as it may exacerbate psoriasis.

Special Populations
Pregnant Women: Drugs that act directly on the renin-angiotensin system (RAS) can cause fetal and neonatal morbidity and death when administered to pregnant women. When pregnancy is detected, Sandoz Irbesartan HCT should be discontinued as soon as possible.

The use of ARB is contraindicated during pregnancy. Epidemiological evidence regarding the risk of teratogenicity following exposure to ACE inhibitors (another class of therapeutic products interfering with the RAAS) during the first trimester of pregnancy has not been conclusive; however a small increase in risk cannot be excluded. Given the current evidence available on the risk with ARB, similar risks may exist for this class of drugs. Patients planning pregnancy should be changed to alternative anti-hypertensive treatments which have an established safety profile for use in pregnancy. When pregnancy is diagnosed, treatment with ARBs should be stopped immediately, and, if appropriate, alternative therapy should be started.

The use of ARBs during the second and third trimesters is known to induce human fetotoxicity (decreased renal function, oligohydramnios, skull ossification, retardation) and neonatal toxicity (renal failure, hypotension, hyperkalaemia).
Infants with histories of *in utero* exposure to an ARB should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support of blood pressure and renal perfusion. Exchange transfusion may be required as means of reversing hypotension and/or substituting for impaired renal function; however, limited experience with those procedures has not been associated with significant clinical benefit. Irbesartan is not removed by hemodialysis.

Thiazides cross the placental barrier and appear in cord blood. The routine use of diuretics in otherwise healthy pregnant women is not recommended and exposes mother and fetus to unnecessary hazard, including fetal or neonatal jaundice, thrombocytopenia, and possibly other adverse reactions that have occurred in adults. Diuretics do not prevent development of toxemia of pregnancy and there is no satisfactory evidence that they are useful in the treatment of toxemia.

**Nursing Women:** It is not known whether irbesartan is excreted in human milk, but significant levels of radioactivity have been found in the milk of lactating rats. Thiazides appear in human milk. Thiazides in high doses causing intense diuresis can inhibit the milk production.

Because many drugs are excreted in human milk and because of their potential for affecting the nursing infant adversely, a decision should be made whether to discontinue nursing or discontinue the drug, taking into account the importance of the drug to the mother.

**Pediatrics (< 18 years of age):** Safety and effectiveness have not been established.

**Geriatrics (> 65 years of age):** Of the 2650 hypertensive patients receiving irbesartan/hydrochlorothiazide in clinical studies, 618 patients were ≥ 65 years of age. No overall age-related differences were seen in the adverse effect profile but greater sensitivity in some older individuals cannot be ruled out.

**ADVERSE REACTIONS**

**Adverse Drug Reaction Overview**

Irbesartan/hydrochlorothiazide was evaluated for safety in 2746 patients with essential hypertension including 968 patients for ≥ 1 year.

The most commonly reported adverse events (AEs) (occurring in ≥10% of patients treated with irbesartan/hydrochlorothiazide) was headache (11.0%), which occurred at a significantly higher incidence in the placebo group (16.1%).

The AEs most frequently resulting in clinical intervention (discontinuation of irbesartan/hydrochlorothiazide) were due to dizziness (0.7%) and headache (0.7%). The AE of hypotension is more likely to occur in volume depleted patients (See WARNINGS AND PRECAUTIONS, related to Cardiovascular under Hypotension).

The following potentially serious adverse reactions have been reported rarely with irbesartan in controlled clinical trials: syncope, hypotension.
Clinical Trial Adverse Drug Reactions
Because clinical trials are conducted under very specific conditions the adverse reaction rates observed in the clinical trials may not reflect the rates observed in practice and should not be compared to the rates in the clinical trials of another drug. Adverse drug reaction information from clinical trials is useful for identifying drug-related adverse events and for approximating rates.

Hypertension
In placebo-controlled clinical trials, therapy was discontinued due to a clinical or laboratory AE in 3.6% of patients treated with irbesartan/hydrochlorothiazide, versus 6.8% of patients given placebo.

AEs regardless of drug relationship, occurring in ≥1% of the irbesartan/hydrochlorothiazide patients in placebo-controlled clinical trials include the following:

Table 1 - Adverse events regardless of drug relationship, occurring in ≥1% of the irbesartan/hydrochlorothiazide patients in placebo-controlled clinical trials

Severe Hypertension:
In a clinical study in patients with severe hypertension (SeDBP ≥110 mmHg), the overall pattern of AEs reported through seven weeks of follow-up was similar in patients treated with irbesartan/hydrochlorothiazide as initial therapy and in patients treated with irbesartan as initial therapy.

The incidence of the pre-specified AEs was: 0% reported cases of syncope in either treatment group; 0.6% and 0% cases of hypotension, 3.6% and 4.0% cases of dizziness, 4.3% and 6.6% cases of headache, 0.2% and 0% cases of hyperkalemia, and 0.6% and 0.4% cases of hypokalemia reported in the group treated with irbesartan/hydrochlorothiazide and the group treated with irbesartan, respectively.

The rate of discontinuation due to AEs was 1.9% and 2.2% in the group treated with irbesartan/hydrochlorothiazide and the group treated with irbesartan, respectively.

Irbesartan Alone
In addition, the following potentially important events occurred in < 1% of patients receiving irbesartan, regardless of drug relationship:

Body as a Whole: chills, facial edema, fever, upper extremity edema;
Cardiovascular: angina pectoris, arrhythmic/conduction disorder, cardiac murmur, cardio-respiratory arrest, flushing, heart failure, hypertension, hypertensive crisis, myocardial infarction, syncope;

Dermatologic: dermatitis, ecchymosis, erythema, erythema face, photosensitivity, pruritus, urticaria;

Endocrine: gout, libido disorder, sexual dysfunction;

Gastrointestinal: abdominal distention, constipation, flatulence, gastroenteritis, hepatitis;

Musculoskeletal: arthritis, bursitis, extremity swelling, joint stiffness, muscle cramp, muscular weakness, musculoskeletal chest pain, musculoskeletal trauma, myalgia;

Nervous System: cerebrovascular accident, depression, emotional disturbances, numbness, paraesthesia, sleep disturbance, somnolence, transient ischemic attack, tremor, vertigo;

Renal/Genitourinary: abnormal urination, prostate disorder;

Respiratory: congestion, dyspnea, epistaxis, pulmonary congestion, tracheobronchitis, wheezing;

Special Senses: conjunctivitis, ear infection, ear pain, hearing impaired, taste disturbance, visual disturbance.

**Hydrochlorothiazide alone**

Other adverse events that have been reported with hydrochlorothiazide, without regard to causality, are listed below:

**Body as a Whole**: weakness;

**Digestive**: cramping, gastric irritation, jaundice (intrahepatic cholestatic jaundice), pancreatitis, sialadenitis;

**Hematologic**: agranulocytosis, aplastic anemia, hemolytic anemia, leukopenia, thrombocytopenia;

**Hypersensitivity**: anaphylactic reactions, fever, necrotizing angitis (vasculitis and cutaneous vasculitis), photosensitivity, purpura, respiratory distress including pneumonitis and pulmonary edema, urticaria;

**Metabolic**: glycosuria, hyperglycemia, hyperuricemia;

**Musculoskeletal**: muscle spasm;

**Nervous System/Psychiatric**: restlessness;

**Renal**: interstitial nephritis, renal dysfunction, renal failure;
Skin: erythema multiforme including Stevens-Johnson syndrome, exfoliative dermatitis including toxic epidermal necrolysis;

Special Senses: transient blurred vision, xanthopsia.

Abnormal Hematologic and Clinical Chemistry Findings

Irbesartan/hydrochlorothiazide

Liver Function Tests: Occasional elevations of liver enzymes and/or serum bilirubin have occurred. In patients with essential hypertension treated with irbesartan/hydrochlorothiazide alone, one patient was discontinued due to elevated liver enzymes.

Creatinine, Blood Urea Nitrogen: Minor increases in blood urea nitrogen (BUN) or serum creatinine were observed in 2.3% of patients. No patient was discontinued due to increased BUN. One patient was discontinued due to a minor increase in serum creatinine.

Irbesartan

Liver Function Tests: In placebo-controlled trials, elevations of aspartate aminotransferase (AST) and alanine transaminase (ALT) ≥3X upper limit of normal (ULN) occurred in 0.1% and 0.2%, respectively, of irbesartan treated patients compared to 0.3% and 0.3%, respectively, of patients receiving placebo. In patients treated with irbesartan for a mean duration of >1 year, the cumulative incidence of AST and/or ALT elevations ≥3X ULN was 0.4%.

Hyperkalemia: In placebo-controlled trials, greater than a 10% increase in serum potassium was observed in 0.4% of irbesartan treated patients compared to 0.5% of patients receiving placebo.

Creatinine, Blood Urea Nitrogen: Minor increases in BUN or serum creatinine were observed in less than 0.7% of patients with essential hypertension treated with irbesartan alone versus 0.9% on placebo.

Hemoglobin: Mean decreases in hemoglobin of 0.16g/dL were observed in patients receiving irbesartan. No patients were discontinued due to anemia.

Neutropenia: Neutropenia (<1000 cells/mm³) was observed in 0.3% of irbesartan treated patients compared to 0.5% of patients receiving placebo.

In clinical trials, the following were noted to occur with an incidence of <1%, regardless of drug relationship: anemia, increased creatinine phosphokinase (CPK), lymphocytopenia, thrombocytopenia.

Post-Market Adverse Drug Reactions

The following adverse reactions were reported in post-marketing use:

Related to Irbesartan+ hydrochlorothiazide
General: asthenia, syncope;

Hepatic/Biliary/Pancreatic: hepatobiliary disorders (acute hepatitis, cholestatic or cytolytic hepatitis); elevated liver function tests; jaundice;

Immune: anaphylactic reactions, anaphylactic shock; angioedema (involving swelling of the face, lips, and/or tongue) has been reported rarely;

Musculoskeletal: myalgia;

Renal: impaired renal function including cases of renal failure in patients at risk (see WARNINGS AND PRECAUTIONS – Renal - Renal Impairment);

Related to Irbesartan
Musculoskeletal: Cases of muscle pain, muscle weakness, myositis and rhabdomyolysis have been reported in patients receiving angiotensin II receptor blockers.

Related to hydrochlorothiazide
Ear/Nose/Throat: tinnitus;

Gastrointestinal: anorexia, gastric irritation, sialadenitis;

Hematologic: agranulocytosis, bone marrow depression, leucopenia, thrombocytopenia (including thrombocytopenic purpura);

Hepatic/Biliary/Pancreatic: pancreatitis;

Immune: necrotizing angiitis (vasculitis, cutaneous vasculitis), photosensitivity;

Ophthalmologic: eye disorders (transient blurred vision, secondary acute angle-closure glaucoma and/or acute myopia), xanthopsia.

Renal: interstitial nephritis;

Respiratory: respiratory distress (including pneumonitis and pulmonary oedema),

Skin: psoriasis (and psoriasis exacerbation), toxic epidermal necrolysis

DRUG INTERACTIONS

Overview
Irbesartan does not substantially induce or inhibit the following isoenzymes: CYP 1A1, 1A2, 2A6, 2B6, 2D6, 2E1. There was no induction or inhibition of CYP 3A4.

**Legend:** C = Case Study; RCS = Retrospective Cohort Study; CT = Clinical Trial; T = Theoretical

**Drug-Food Interactions**
No statistically significant effects of food were observed on the \( C_{\text{max}} \), \( AUC_{(\text{inf})} \) or \( T_{1/2} \) of irbesartan or on the \( AUC_{(\text{inf})} \) or \( T_{1/2} \) of hydrochlorothiazide. In the fasted and fed states, \( T_{\text{max}} \) increased from 1 to 2 hours for irbesartan and from 1.5 to 3.5 hours for hydrochlorothiazide. The \( C_{\text{max}} \) for hydrochlorothiazide decreased 21% in the fed state relative to the fasted state. None of these changes were considered to be clinically significant.

**Drug-Herb Interactions**
There have been no clinical studies to assess the possible interaction of any herbal products and irbesartan/hydrochlorothiazide.

**DOSAGE AND ADMINISTRATION**

**Dosing Considerations**
- Dosage must be individualized.
- The fixed combination is not for initial therapy except for severe hypertension.
- The dose of Sandoz Irbesartan HCT should be determined by the titration of the individual
components.

- Use of Sandoz Irbesartan HCT in patients with liver impairment is not advisable.
- Dosage adjustment may be required in hemodialysis patients (see Recommended Dose and Dosage Adjustment - Adjustment in Renal Insufficiency).

**Recommended Dose and Dosage Adjustment**

Once the patient has been stabilized on the individual components as described below, either one tablet of Sandoz Irbesartan HCT 150/12.5 mg, 300/12.5 mg or 300/25 mg once daily may be substituted if the doses on which the patient was stabilized are the same as those in the fixed combination.

Sandoz Irbesartan HCT may be administered with or without food, however it should be taken consistently with respect to food intake.

**Irbesartan Monotherapy**

The recommended dose of irbesartan is 150 mg once daily. In patients whose blood pressure is not adequately controlled, the daily dose may be increased to 300 mg.

**Severe Hypertension (Sitting DBP ≥ 110 mmHg)**

The starting dose of Sandoz Irbesartan HCT for initial treatment of severe hypertension is one tablet of Sandoz Irbesartan HCT 150/12.5 mg once daily (see INDICATIONS AND CLINICAL USE and CLINICAL TRIALS, Severe Hypertension). The dosage may be increased after 2 - 4 weeks of therapy to a maximum of 300/25 mg once daily. Sandoz Irbesartan HCT is not recommended as initial therapy in patients with intravascular volume depletion (see WARNINGS AND PRECAUTIONS, Hypotension).

**Dose Adjustment In Special Population**

**Diuretic Treated Patients**

In patients receiving diuretics, irbesartan therapy should be initiated with caution, since these patients may be volume-depleted and thus more likely to experience hypotension following initiation of additional antihypertensive therapy. Whenever possible, all diuretics should be discontinued 2 - 3 days prior to the administration of irbesartan to reduce the likelihood of hypotension (see WARNINGS AND PRECAUTIONS, Cardiovascular, Hypotension, and DRUG INTERACTIONS). If this is not possible because of the patient’s condition, irbesartan should be administered with caution and the blood pressure monitored closely. The recommended starting dose of irbesartan is 75 mg once daily in hypovolemic patients (see WARNINGS AND PRECAUTIONS, Cardiovascular, Hypotension). Thereafter, the dosage should be adjusted according to the individual response of the patient.

**Geriatrics**

No initial dosage adjustment in irbesartan is necessary for most elderly patients. Appropriate caution should nevertheless be used when prescribing to the elderly, as increased vulnerability to drug effect is possible in this patient population. [See WARNINGS AND PRECAUTIONS, Special Populations - Geriatrics].

**Hepatic Insufficiency**

No initial dosage adjustment in irbesartan is generally necessary in patients with mild to
moderate hepatic impairment. Since thiazide diuretics may precipitate hepatic coma, the use of a fixed combination product such as Sandoz Irbesartan HCT is not advisable.

Renal Insufficiency
No initial dosage adjustment in irbesartan is generally necessary in patients with renal impairment, although due to the apparent greater sensitivity of hemodialysis patients, an initial dose of 75 mg is recommended in this group of patients.

The usual regimens of therapy with Sandoz Irbesartan HCT may be followed as long as the patient’s creatinine clearance is >30mL/min. In patients with more severe renal impairment, loop diuretics are preferred to thiazides so Sandoz Irbesartan HCT is not recommended.

Missed Dose
Patients should be instructed to take Sandoz Irbesartan HCT at the next scheduled dose and not take two doses at the same time if they miss a dose.

OVERDOSAGE

For management of a suspected drug overdose, contact your regional Poison Control Centre.

No specific information is available on the treatment of overdosage with Sandoz Irbesartan HCT. The patient should be closely monitored, and the treatment should be symptomatic and supportive, including fluid and electrolyte replacement.

Irbesartan
No data or very little data available in regard to overdosage in humans.

The most likely manifestations of overdosage would be hypotension and/or tachycardia; bradycardia might also occur in this setting. Irbesartan is not removed by hemodialysis.

Hydrochlorothiazide
The most common signs and symptoms observed are those caused by electrolyte depletion (hypokalemia, hypochloremia, hyponatremia) and dehydration resulting from excessive diuresis. If digitalis has also been administered, hypokalemia may accentuate cardiac arrhythmias.

The degree to which hydrochlorothiazide is removed by hemodialysis has not been established.

ACTION AND CLINICAL PHARMACOLOGY

Mechanism of Action
Irbesartan/hydrochlorothiazide combines the actions of irbesartan, an angiotensin II AT₁ receptor blocker (ARB), and that of a thiazide diuretic, hydrochlorothiazide.

Irbesartan
Irbesartan antagonizes angiotensin II by blocking AT₁ receptors.
Angiotensin II is the primary vasoactive hormone in the renin-angiotensin system (RAS). Its effects include vasoconstriction and the stimulation of aldosterone secretion by the adrenal cortex.

Irbesartan blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II by selectively blocking in a non-competitive manner the binding of angiotensin II to the AT₁ receptor found in many tissues. Irbesartan has no agonist activity at the AT₁ receptor. AT₂ receptors have been found in many tissues, but to date they have not been associated with cardiovascular homeostasis. Irbesartan has essentially no affinity for the AT₂ receptors.

Irbesartan does not inhibit ACE, also known as kininase II, the enzyme that converts angiotensin I to angiotensin II and degrades bradykinin, nor does it affect renin or other hormone receptors or ion channels involved in cardiovascular regulation of blood pressure and sodium homeostasis.

**Hydrochlorothiazide**
Hydrochlorothiazide is a thiazide diuretic. Thiazides affect the renal tubular mechanisms of electrolyte reabsorption, directly increasing excretion of sodium and chloride in approximately equivalent amounts. Indirectly, the diuretic action of hydrochlorothiazide reduces plasma volume, with consequent increases in plasma renin activity, increases in aldosterone secretion, increases in urinary potassium loss, and decreases in serum potassium. The renin-aldosterone link is mediated by angiotensin II, so coadministration of an ARB tends to reverse the potassium loss associated with these diuretics.

The mechanism of the antihypertensive effect of thiazides is not fully understood.

**Pharmacodynamics**

**Irbesartan**
In healthy subjects, single oral doses of irbesartan ≤ 300 mg produced dose-dependent inhibition of the pressor effect of angiotensin II infusions. The inhibition was complete (100%) 4 hours following oral doses of 150 mg or 300 mg. Partial inhibition of 40% and 60% was still present 24 hours post-dose with 150 mg and 300 mg irbesartan respectively.

In hypertensive patients, angiotensin II receptor inhibition following chronic administration of irbesartan caused a 1.5-2 fold rise in angiotensin II plasma concentration and a 2-3 fold increase in plasma renin levels. Aldosterone plasma concentrations generally declined following irbesartan administration, however serum potassium levels were not significantly affected at recommended doses.

During clinical trials, minimal incremental blood pressure response was observed at doses > 300 mg.

The blood pressure lowering effect of irbesartan was apparent after the first dose and substantially present within 1-2 weeks, with the maximal effect occurring by 4-6 weeks. In long-term studies, the effect of irbesartan appeared to be maintained for more than one year. There was essentially no change in average heart rate in patients treated with irbesartan in controlled trials.
There was no rebound effect after withdrawal of irbesartan.

Black hypertensive patients had a smaller blood pressure response to irbesartan monotherapy than caucasians.

There was no significant difference in blood pressure response based on age and gender.

**Hydrochlorothiazide**

Onset of the diuretic action following oral administration occurred in 2 hours and the peak action in about 4 hours. Diuretic activity lasts about 6 - 12 hours.

**Irbesartan/Hydrochlorothiazide**

The components of irbesartan/hydrochlorothiazide were shown to have an additive effect on blood pressure reduction, reducing blood pressure to a greater degree than either component alone.

The blood pressure lowering effect of irbesartan in combination with hydrochlorothiazide was apparent after the first dose and substantially present within 1-2 weeks, with the maximal effect occurring by 6-8 weeks. In long-term follow-up studies, the effect of irbesartan/hydrochlorothiazide was maintained for >1 year.

**Pharmacokinetics**

<td>5-15</td>
<td>Plasma 192-343 Predominantly Renal (unchanged)</td>
<td>1.5-4.2</td>
</tr>
</tbody>
</table>

**Irbesartan**

**Absorption**

Irbesartan is an orally active agent. The oral absorption of irbesartan is rapid and complete with an average absolute bioavailability of 60% - 80%. Following oral administration, peak plasma concentrations are attained at 1.5-2 hours after dosing. Steady-state concentrations are achieved within 3 days.

**Distribution**

The average volume of distribution of irbesartan is 53-93 litres.
Irbesartan is approximately 96% protein-bound in the plasma, primarily to albumin and α₁-acid glycoprotein.

**Metabolism:**
Irbesartan is metabolized via glucuronide conjugation, and oxidation by the cytochrome P-450 system.

**Excretion**
Irbesartan and its metabolites are excreted by both biliary and renal routes. Following either oral or intravenous administration of 14C-labeled irbesartan, about 20% of radioactivity is recovered in the urine and the remainder in the feces. Less than 2% of the dose is excreted in urine as unchanged irbesartan. Irbesartan exhibits linear pharmacokinetics over the therapeutic dose range with an average terminal elimination half-life of 11-15 hours.

Total plasma and renal clearances are in the range of 157 - 176 and 3.0 - 3.5 mL/minute, respectively.

**Hydrochlorothiazide**

**Absorption**
Hydrochlorothiazide is rapidly absorbed from the gastrointestinal tract. The bioavailability is approximately 65 - 70%.

**Distribution**
Hydrochlorothiazide crosses the placental but not the blood-brain barrier and is excreted in breast milk.

**Metabolism**
Hydrochlorothiazide is not metabolized.

**Excretion**
Hydrochlorothiazide is eliminated rapidly by the kidney. At least 61% of the oral dose is eliminated unchanged within 24 hours. The plasma half-life has been observed to vary from 5.6 and 14.8 hours.

**Special Populations and Conditions**

**Geriatrics:** In subjects > 65 years old, irbesartan elimination half-life was not significantly altered, but AUC and C\text{max} values were about 20 - 50% greater than those of young subjects.

**Renal Insufficiency:** The mean AUC and C\text{max} of irbesartan were not altered in patients with any degree of renal impairment, including patients on hemodialysis. However, a wide variance was seen in patients with severe renal impairment.

**Hepatic Insufficiency:** The pharmacokinetics of irbesartan following repeated oral administration were not significantly affected in patients with mild to moderate cirrhosis of the liver. No data is available in patients with severe liver disease.
STORAGE AND STABILITY

Sandoz Irbesartan HCT (irbesartan/hydrochlorothiazide) tablets can be stored between 15 and 30°C.

DOSAGE FORMS, COMPOSITION AND PACKAGING

Sandoz Irbesartan HCT (irbesartan/hydrochlorothiazide) 150 mg/12.5 mg: apricot, oval biconvex film-coated tablets, debossed with 150H on one side

Sandoz Irbesartan HCT (irbesartan/hydrochlorothiazide) 300 mg/12.5 mg: apricot, oval biconvex film-coated tablets, debossed with 300H on one side

Sandoz Irbesartan HCT (irbesartan/hydrochlorothiazide) 300 mg/25 mg: dark pink, oval biconvex film-coated tablets, debossed with 300 on one side and 25H on other side

In addition to the active ingredients, each tablet contains:
croscarmellose sodium, hydroxypropylcellulose, hypromellose, lactose monohydrate, magnesium stearate, microcrystalline cellulose, silica colloidal anhydrous, polyethylene glycol, titanium dioxide, talc

Sandoz Irbesartan HCT 150/12.5 mg and 300/12.5 mg also contain ferric oxide red and ferric oxide yellow.

Sandoz Irbesartan HCT 300 mg/25 mg also contains ferric oxide red and ferric oxide black.

150/12.5 mg, 300/25 mg and 300/12.5 mg tablets are available in bottles of 30, 100, and 500 tablets.

**Irbesartan-Hydrochlorothiazide**
The antihypertensive effects of irbesartan-hydrochlorothiazide tablets were examined in 4 placebo-controlled studies of 8-12 weeks in patients with mild-moderate hypertension. These trials included 1914 patients randomized to fixed doses of irbesartan (37.5 to 300 mg) and concomitant hydrochlorothiazide (6.25 - 25 mg). One factorial study compared all combinations of irbesartan (37.5, 100 and 300 mg or placebo) and hydrochlorothiazide (6.25, 12.5, and 25 mg or placebo). The irbesartan-hydrochlorothiazide combinations of 75/12.5 mg and
150/12.5 mg were compared to their individual components and placebo in a separate study. A third study investigated the ambulatory blood pressure responses to irbesartan - hydrochlorothiazide (75/12.5 mg and 150/12.5 mg) and placebo after 8 weeks of dosing. Another trial investigated the effects of the addition of irbesartan (75 mg) in patients not controlled on hydrochlorothiazide (25 mg) alone.

In controlled trials, the addition of irbesartan 150-300 mg to hydrochlorothiazide doses of 6.25, 12.5 or 25 mg produced further dose-related reductions in blood pressure of 8-10/3-6 mmHg, comparable to those achieved with the same monotherapy dose of irbesartan. The addition of hydrochlorothiazide to irbesartan produced further dose related reductions in blood pressure at trough (24 hours post-dose) of 5-6/2-3 mmHg (12.5 mg) and 7-11/4-5 mmHg (25 mg), also comparable to effects achieved with hydrochlorothiazide alone. Once-daily dosing with 150 mg irbesartan and 12.5 mg hydrochlorothiazide, 300 mg irbesartan and 12.5 mg hydrochlorothiazide, or 300 mg irbesartan and 25 mg hydrochlorothiazide produced mean placebo-adjusted blood pressure reductions at trough (24 hours post-dosing) of about 13-15/7-9, 14/9-12, and 19-21/11-12 mmHg, respectively. Peak effects occurred at 3-6 hours, with the trough-to peak ratios >65%.

In another study, irbesartan (75-150 mg) or placebo was added on a background of 25 mg hydrochlorothiazide in patients not adequately controlled (SeDBP 93-120 mmHg) on hydrochlorothiazide (25 mg) alone. The addition of irbesartan (75-150 mg) gave an additive effect (systolic/diastolic) at trough (24 hours post-dosing) of 11/7 mmHg.

There was no difference in response for men and women or in patients over or under 65 years of age. Black patients had a larger response to hydrochlorothiazide than non-black patients and a smaller response to irbesartan. The overall response to the combination was similar for black and non-black patients.

**Severe Hypertension**

The efficacy of irbesartan/hydrochlorothiazide as initial therapy for severe hypertension (defined as a mean seated diastolic blood pressure (SeDBP) ≥110 mmHg confirmed on 2 separate occasions off all antihypertensive therapy) was studied in a 7-week, double-blind, randomized, multicenter study. Patients were randomized to either irbesartan and hydrochlorothiazide (150/12.5 mg) or to irbesartan (150 mg) once daily and followed for blood pressure response. These initial study regimens were increased at 1 week to irbesartan 300 mg/HCTZ 25 mg or to irbesartan 300 mg, respectively. The primary endpoint was a comparison at 5 weeks of the proportion of patients who achieved through SeDBP <90 mmHg. An additional supportive endpoint compared the proportion of subjects in each treatment group whose blood pressure was controlled, defined as simultaneous SeDBP <90 mmHg and SeSBP <140 mmHg.

**Study demographics and trial design**

The study randomized 697 patients, in a 2:1 ratio to receive either combination therapy (irbesartan plus HCTZ, N=468) or irbesartan monotherapy (N=229), and included 296 (42%) females, 101 (14%) blacks, and 92 (13%) ≥65 years of age. The mean age was 52 years. The mean blood pressure at baseline for the total population was 172/113 mmHg.

**Study results**

The study results are summarized in Table 7.

After 5 weeks of therapy, the mean SeDBP was 4.7 mmHg lower (p≤0.0001) and the mean SeSBP was 9.7 mmHg lower (p<0.0001) in the group treated with irbesartan/hydrochlorothiazide than in the group treated with irbesartan. Mean reductions from baseline for SeDBP and SeSBP at trough were 24.0 mmHg and 30.8 mmHg for irbesartan/hydrochlorothiazide-treated patients and 19.3 mmHg and 21.1 mmHg for irbesartan-treated patients, respectively. A greater proportion of patients on irbesartan/hydrochlorothiazide achieved a diastolic blood pressure <90 mmHg (47.2% for irbesartan/hydrochlorothiazide, 33.2% for irbesartan; p=0.0005) and a greater proportion of the patients on irbesartan/hydrochlorothiazide achieved simultaneous control of SeSBP <140 mmHg and SeDBP <90 mmHg (34.6% versus 19.2%; p<0.0001). Similar results were seen when the patients were grouped according to gender, race or age (<65 years, ≥65 years). The proportions of subjects with controlled SeDBP, as well as with simultaneous SeSBP/SeSBP control, at each week of the double-blind period were consistently larger and statistically significantly greater for irbesartan/hydrochlorothiazide-treated patients than for irbesartan-treated patients.

DETAILED PHARMACOLOGY

Pharmacokinetics
Irbesartan
Following either oral or intravenous administration of $^{14}$C-labeled irbesartan, > 80% of the circulating plasma radioactivity was attributable to unchanged irbesartan. The primary circulating metabolite was the inactive irbesartan glucuronide (approximately 6%). The remaining oxidative metabolites did not add appreciably to the pharmacologic activity.

In vitro studies of irbesartan indicated that the oxidation of irbesartan was primarily by cytochrome P-450 isoenzyme CYP 2C9. Metabolism of irbesartan by CYP 3A4 was negligible. Irbesartan was neither metabolized, nor does it substantially induce or inhibit the following isoenzymes: CYP 1A1, 1A2, 2A6, 2B6, 2D6, 2E1. There was no induction or inhibition of CYP 3A4.

Hydrochlorothiazide
Hydrochlorothiazide was not metabolized but is eliminated rapidly by the kidney. The plasma half-life was observed to vary between 5.6 and 14.8 hours when the plasma levels could be followed for at least 24 hours. At least 61 percent of the oral dose was eliminated unchanged within 24 hours.

After single administration, toxicity was slight and no target organ was identified. Very few toxic effects, characterized by pilo-erection and/or somnolence were noted at 2000 mg/kg by the oral route, 200 mg/kg by the intraperitoneal route and 50 mg/kg by the intravenous route. Acute oral toxicity studies with irbesartan in mice and rats indicated acute lethal doses were in excess of 2000 mg/kg, about 25 - 50 fold the maximum human dose (300 mg) on a mg/m$^2$ basis, respectively.

No mortality occurred following administration of the irbesartan/hydrochlorothiazide combination up to and including the highest dose of irbesartan: hydrochlorothiazide (2000/4000 mg/kg in mice or 3000/500 mg/kg in rats). No treatment-related clinical signs and body weight changes were observed. At necropsy, performed at the end of the 14-day observation period, pathologic examinations did not reveal any treatment-induced changes.

</tr>
<tr>
<td>Monkey M (5) F (5)</td>
<td>0, 20, 100, 500</td>
<td>PO</td>
<td>52 Weeks</td>
<td>-</td>
<td>Irbesartan was well tolerated and most of the changes observed were considered to be due to the pharmacological activity of the drug: Dose-related decrease in blood pressure at doses ≥20 mg/kg/day associated with necrosis of the tip of the tail likely due to a decrease in blood flow at 500 mg/kg/day. Dose-related hyperplasia / hypertrophy of the juxtaglomerular apparatus in all treated animals with degenerative kidney changes at 500 mg/kg/day. Slight decrease in body weight gain and erythrocyte parameters at doses ≥100 mg/kg/day.</td>
</tr>
</tbody>
</table>
After repeated oral administrations at dose levels up to 1000 mg/kg per day, most of the treatment-related effects noted in all species are linked to the pharmacological activity of irbesartan. The kidney can be considered as the primary target organ: hyperplasia/hypertrophy of the juxtaglomerular apparatus which was observed in all species, is a direct consequence of the interaction with the renin-angiotensin system. Irbesartan also induced some hematology (slight decrease in erythrocyte parameters) and blood biochemistry variations (slight increase in urea, creatinine, phosphorus, potassium and calcium levels) likely due to a disturbance in the renal blood flow, and a slight decrease in heart weight which could result from a decrease in cardiac work load due to decreased peripheral vascular resistance. At high doses (>500 mg/kg per day), degenerative changes of the kidney were noted which could be secondary to prolonged hypotensive effects.

  • Body weights of males in the high dose combination group (90/90) were mildly decreased.  
  • Mean hemoglobin, hematocrit and erythrocyte values were mildly to moderately decreased at the high dose combination (90/90).  
  • Moderate increases in BUN; mild to moderate increases in creatinine values; mean sodium, potassium, and chloride values were mildly to moderately decreased.  
  • Mild to moderate juxtaglomerular apparatus, hypertrophy/hyperplasia [all treated with irbesartan either alone or in combination]. |

*Irbesartan  
**Hydrochlorothiazide
Reproduction and Teratology

Irbesartan
Fertility and reproductive performance were not affected in studies of male and female rats even at oral doses of irbesartan causing pronounced toxicity (up to 650 mg/kg/day). No significant effects on the number of corpora lutea, implants, or live fetuses were observed. Irbesartan did not affect survival, development, or reproduction of offspring except for a slight decrease of body weight gain during lactation which was reversible after weaning.

In a study of rats receiving maternally toxic doses of irbesartan (650 mg/kg/day), transient effects were observed in fetuses. These effects included increased incidences of renal pelvic cavitation at doses $\geq 50$ mg/kg/day and subcutaneous edema at doses $\geq 180$ mg/kg/day. Slight decreases in body weight gain were noted (prior to weaning) in offspring of females receiving irbesartan at doses $\geq 50$ mg/kg/day. In rabbits, maternally toxic doses of irbesartan (30 mg/kg/day) were associated with maternal mortality and abortion. Surviving females receiving this dose had a slight increase in early resorption. However, no teratogenic effect was observed. Radioactivity was present in the rat and rabbit fetus during late gestation and in rat milk following oral doses of radiolabeled irbesartan. These findings are attributed to drug exposure in late gestation and during lactation.

Irbesartan/hydrochlorothiazide
In a Segment II teratology study carried out in rats, a dose of the combination irbesartan/hydrochlorothiazide up to 150/150 mg/day/kg did not show any teratogenic potential. There was decreased foetal body weight in the litters of dams given 150/150 mg/kg/day.

Carcinogenicity and Mutagenicity

Irbesartan
No evidence of carcinogenicity was observed when irbesartan was administered at doses of up to 500/1000 mg/kg/day (males/females, respectively) in rats and 1000 mg/kg/day in mice for 2 years. These doses provided systemic exposures of 3.6 - 24.9 times (rats) and 3.8 - 6.2 times (mice) the exposures in humans receiving 300 mg daily.

Irbesartan was not mutagenic in a battery of in vitro tests (Ames microbial test, rat hepatocyte DNA repair test, V79 mammalian cell forward gene mutation assay). Irbesartan was negative in several tests for induction of chromosomal aberrations (in vitro - human lymphocyte assay; in vivo - mouse micronucleus study).

Irbesartan/Hydrochlorothiazide
No carcinogenicity studies have been conducted with the irbesartan/hydrochlorothiazide combination.

Irbesartan/hydrochlorothiazide was not mutagenic in standard in vitro tests (Ames microbial test and Chinese hamster mammalian-cell forward gene-mutation assay).

Irbesartan/hydrochlorothiazide was negative in tests for induction of chromosomal aberrations (in vitro - human lymphocyte assay; in vivo - mouse micronucleus study).

Sandoz Irbesartan HCT
PART III: CONSUMER INFORMATION

**Sandoz Irbesartan HCT**
irbesartan/hydrochlorothiazide tablets

Read this carefully before you start taking Sandoz Irbesartan HCT and each time you get a refill. This leaflet is a summary and will not tell you everything about Sandoz Irbesartan HCT. Talk to your doctor, nurse, or pharmacist about your medical condition and treatment and ask if there is any new information about Sandoz Irbesartan HCT.

ABOUT THIS MEDICATION

What the medication is used for:
Sandoz Irbesartan HCT lowers high blood pressure.

What it does:
Sandoz Irbesartan HCT is a combination of 2 drugs, irbesartan and hydrochlorothiazide:
- Irbesartan is an angiotensin receptor blocker (ARB). You can recognize an ARB because its medicinal ingredient ends in “SARTAN”. It lowers blood pressure.
- Hydrochlorothiazide is a diuretic or “water pill” that increases urination. This lowers blood pressure.

This medicine does not cure high blood pressure. It helps to control it. Therefore, it is important to continue taking Sandoz Irbesartan HCT regularly even if you feel fine.

When it should not be used:
Do not take Sandoz Irbesartan HCT if you:
- Are allergic to irbesartan or hydrochlorothiazide or to any non-medicinal ingredients in the formulation
- Are allergic to any sulfonamide-derived drugs (sulfa drugs); most of them have a medicinal ingredient that ends in “MIDE”.
- Have experienced an allergic reaction (angioedema) with swelling of the hands, feet, or ankles, face, lips, tongue, throat, or sudden difficulty breathing or swallowing to any ARB (any drug in the same class as irbesartan). Be sure to tell your doctor, nurse, or pharmacist that this has happened to you.
- Have difficulty in urinating or produce no urine;
- Have diabetes or kidney disease and are already taking:
  - a blood pressure-lowering medicine that contains aliskiren
  - an angiotensin converting enzyme (ACE) inhibitor. You can recognize ACE inhibitors because their medicinal ingredient ends in ‘-PRIL’
- Are pregnant or intend to become pregnant; Taking Sandoz Irbesartan HCT during pregnancy can cause injury and even death to your baby.
- Are breast-feeding. Sandoz Irbesartan HCT passes into breast milk.
- Have one of the following rare hereditary diseases:
  - Galactose intolerance
  - Lapp lactase deficiency
  - Glucose-galactose malabsorption

Because lactose is a non-medicinal ingredient in Sandoz Irbesartan HCT

Sandoz Irbesartan HCT is not recommended for use in children and adolescents (under the age of 18 years).

What the medicinal ingredients are:
Irbesartan and hydrochlorothiazide.

What the nonmedicinal ingredients are:
Croscarmellose sodium, hydroxypropylcellulose, hypromellose, lactose monohydrate, magnesium stearate, microcrystalline cellulose, silica colloidal anhydrous, polyethylene glycol, titanium dioxide, talc.

Sandoz Irbesartan HCT 150/12.5 mg and 300/12.5 mg also contain ferric oxide red and ferric oxide yellow.

Sandoz Irbesartan HCT 300 mg/25 mg also contains ferric oxide red and ferric oxide black.

What dosage forms it comes in:
Sandoz Irbesartan HCT tablets are oval biconvex film-coated tablet, available in three dosage strengths:
- 150 mg/12.5 mg is apricot, debossed with 150H on one side
- 300 mg/12.5 mg is apricot, debossed with 300H on one side
- 300 mg/25 mg is dark pink, debossed with 300 on one side and 25H on other side

WARNINGS AND PRECAUTIONS

**Serious Warnings and Precautions - Pregnancy**

Sandoz Irbesartan HCT should not to be used during pregnancy. If you discover that you are pregnant while taking Sandoz Irbesartan HCT stop the medication and please contact your doctor, nurse, or pharmacist as soon as possible.

BEFORE you use Sandoz Irbesartan HCT tell your doctor, nurse, or pharmacist if you:
- Are allergic to any drug used to lower blood pressure, including angiotensin converting enzyme (ACE) inhibitors, or penicillin.
- Have narrowing of an artery or a heart valve.
- Have had a heart attack or stroke.
- Have heart failure.
- Have diabetes, liver or kidney disease.
- Have gout, or lupus erythematosus.
- Have psoriasis or a history of psoriasis.
- Are on dialysis.
• Are dehydrated or suffer from excessive vomiting, diarrhea or sweating.
• Are taking a salt substitute that contains potassium, potassium supplements, or a potassium-sparing diuretic (a specific kind of “water pill” that makes your body keep potassium).
• Are on a low-salt diet.
• Are taking a medicine that contains aliskiren, used to lower high blood pressure. The combination with Sandoz Irbesartan HCT is not recommended.
• Are on a low-salt diet.
• Are taking a medicine that contains aliskiren, used to lower high blood pressure. The combination with Sandoz Irbesartan HCT is not recommended.
• Are less than 18 years old.

Hydrochlorothiazide in Sandoz Irbesartan HCT can cause Sudden Eye Disorders:
- Myopia: sudden nearsightedness or blurred vision.
- Glaucoma: an increased pressure in your eyes, eye pain.
  Untreated, it may lead to permanent vision loss.

These eye disorders are related and can develop within hours to weeks of starting Sandoz Irbesartan HCT.

You may become sensitive to the sun while taking Sandoz Irbesartan HCT. Exposure to sunlight should be minimized until you know how you respond.

Before surgery and general anesthesia (even at the dentist’s office), tell the doctor or dentist that you are taking Sandoz Irbesartan HCT, as there may be a sudden fall in blood pressure associated with general anesthesia.

Hypersensitivity reactions (angioedema, urticarial, anaphylactic reactions including anaphylactic shock) have been reported.

Driving and using machines: Before you perform tasks which may require special attention, wait until you know how you respond to Sandoz Irbesartan HCT. Dizziness, lightheadedness, or fainting can especially occur after the first dose and when the dose is increased.

INTERACTIONS WITH THIS MEDICATION

As with most medicines, interactions with other drugs are possible. Tell your doctor, nurse, or pharmacist about all the medicines you take, including drugs prescribed by other doctors, vitamins, minerals, natural supplements or alternative medicines.

The following may interact with Sandoz Irbesartan HCT:
- Adrenocorticotropic hormone (ACTH) used to treat West Syndrome.
- Alcohol, barbiturates (sleeping pills), or narcotics (strong pain medications). They may cause low blood pressure and dizziness when you go from lying or sitting to standing up.
- Amphotericin B, an antifungal drug.
- Anticancer drugs, including cyclophosphamide and methotrexate.
- Antidepressants, in particular selective serotonin reuptake inhibitors (SSRIs), including citalopram, escitalopram, and sertraline.
- Antidiabetic drugs, including insulin and oral medicines.
- Beta-blockers (medications for heart disease)
- Bile acid resins used to lower cholesterol.
- Blood pressure-lowering drugs, including diuretics (“water pills”), aliskiren-containing products or angiotensin converting enzyme (ACE) inhibitors.
- Calcium or vitamin D supplements.
- Corticosteroids used to treat joint pain and swelling and other conditions.
- Digoxin, a heart medication.
- Drugs that slow down or speed up bowel function, including atropine, metoclopramide, and domperidone.
- Drugs used to treat epilepsy, including carbamazepine and topiramate.
- Gout medications, including allopurinol and probenecid.
- Hyperglycemic agent, such as diazoxide.
- Lithium used to treat bipolar disease.
- Nonsteroidal anti-inflammatory drugs (NSAIDs), used to reduce pain and swelling. Examples include ibuprofen, naproxen, and celecoxib.
- Potassium-sparing diuretics, potassium supplements or potassium-containing salt substitutes.
- Pressor amines such as norepinephrine.
- Skeletal muscle relaxants used to relieve muscle spasms, including tubocurare.
- Warfarin.

PROPER USE OF THIS MEDICATION

Take Sandoz Irbesartan HCT every day exactly as prescribed. It is recommended to take your dose at about the same time every day.

Sandoz Irbesartan HCT can be taken with or without food but it should be taken the same way each day. If Sandoz Irbesartan HCT causes upset stomach, take it with food or milk.

Usual Adult dose:
Patients should be individually titrated for each component separately.
Usual maintenance dose is: 1 tablet daily.

Overdose:
If you think you have taken too much Sandoz Irbesartan HCT, contact your doctor, nurse, pharmacist, hospital emergency department or regional Poison Control Centre immediately, even if there are no symptoms.

Missed dose:
If you have forgotten to take your dose during the day, carry on with the next one at the usual time. Do not double dose.
SIDE EFFECTS AND WHAT TO DO ABOUT THEM

Side effects may include:
- back or leg pain, muscle cramps, spasms and pain, weakness, restlessness
- dizziness, pins and needles in your fingers, headache and fatigue
- constipation, diarrhea, nausea, vomiting, decreased appetite, upset stomach, enlargement of the glands in your mouth
- bleeding under the skin, rash, red patches on the skin
- drowsiness, insomnia
- reduced libido

If any of these affects you severely, tell your doctor, nurse or pharmacist.

Sandoz Irbesartan HCT can cause abnormal blood test results. Your doctor will decide when to perform blood tests and will interpret the results.

This is not a complete list of side effects. For any unexpected effects while taking Sandoz Irbesartan HCT, contact your doctor, nurse or pharmacist.

**HOW TO STORE IT**

Store Sandoz Irbesartan HCT tablets at room temperature (15 to 30°C).

Keep out of reach and sight of children.

**Reporting Side Effects**

You can report any suspected side effects associated with the use of health products to Health Canada by:

- Visiting the Web page on AdverseReaction Reporting (https://www.canada.ca/en/healthcanada/services/drugs-health-products/medeffect-canada.html) for information on how to report online, by mail or by fax; or
- Calling toll-free at 1-866-234-2345.

**NOTE:** Contact your health professional if you need information about how to manage your side effects. The Canada Vigilance Program does not provide medical advice.

This document, plus the full Product Monograph prepared for health professionals, can be obtained by contacting the sponsor, Sandoz Canada Inc., at: 1 800-361-3062 or by written request at: 145, Jules-Léger Boucherville, (QC), Canada J4B 7K8 or by e-mail at: medinfo@sandoz.com
