PART I: HEALTH PROFESSIONAL INFORMATION

1 INDICATIONS

BRUKINSA (zanubrutinib) is indicated:
- for the treatment of adult patients with Waldenström’s macroglobulinemia (WM).
- for the treatment of adult patients with mantle cell lymphoma (MCL) who have received at least one prior therapy.
- for the treatment of adult patients with marginal zone lymphoma (MZL) who have received at least one prior anti-CD20-based therapy.

1.1 Pediatrics

Pediatrics (<18 years of age): No safety and efficacy data are available; therefore, Health Canada has not authorized an indication for pediatric use.

1.2 Geriatrics

Geriatrics (>65 years of age): No clinically relevant differences in safety or efficacy were observed between patients ≥65 years and those younger than 65 years. See 7 WARNINGS AND PRECAUTIONS, Special Populations.

2 CONTRAINDICATIONS

BRUKINSA is contraindicated in patients who are hypersensitive to zanubrutinib or to any ingredient in the formulation, including any non-medicinal ingredient, or component of the container. For a complete listing, see 6 DOSAGE FORMS, STRENGTHS, COMPOSITION AND PACKAGING section of the Product Monograph.

3 SERIOUS WARNINGS AND PRECAUTIONS BOX

**Serious Warnings and Precautions**

- Treatment with BRUKINSA should be initiated and supervised by a qualified physician experienced in the use of anticancer therapies.
- Serious Hemorrhage: (see 7 WARNINGS AND PRECAUTIONS, Vascular).

4 DOSAGE AND ADMINISTRATION

4.1 Dosing Considerations

- Avoid concomitant use with moderate or strong CYP3A inducers (see 9 DRUG INTERACTIONS).
4.2 Recommended Dose and Dosage Adjustment

**Recommended Dose**
The recommended total daily oral dose of BRUKINSA is 320 mg. BRUKINSA may be taken as either 320 mg (four 80 mg capsules) once daily or 160 mg (two 80 mg capsules) twice daily.

Treatment with BRUKINSA should continue until disease progression or unacceptable toxicity.

**Dosage Adjustment**
Recommended dose modifications of BRUKINSA for Grade ≥ 3 adverse reactions are provided in Table 1.

**Table 1: Recommended Dose Modification for Adverse Reaction**

<table>
<thead>
<tr>
<th>Event</th>
<th>Adverse Reaction Occurrence</th>

<td></td>
<td>Once toxicity has resolved to ≤ Grade 1 or baseline: Resume at 80 mg once daily</td>
</tr>
<tr>
<td></td>
<td>Fourth</td>
<td>Discontinue BRUKINSA</td>
</tr>
</tbody>
</table>

Asymptomatic lymphocytosis should not be regarded as an adverse reaction, and these patients should continue taking zanubrutinib.

Recommended dose modification for use with CYP3A inhibitors or inducers are provided in Table 2.
Table 2: Use with CYP3A Inhibitors or Inducers

<table>
<thead>
<tr>

<td>Strong and moderate CYP3A inducer</td>
<td>Avoid concomitant use; Consider alternative agents with less CYP3A induction</td>
</tr>
</tbody>
</table>

After discontinuation of a CYP3A inhibitor, resume previous dose of BRUKINSA.

**Special Populations**

**Pediatrics (<18 years of age):** Health Canada has not authorized an indication for pediatric use.

**Geriatrics (≥65 years of age):** No dose modification is necessary based on age (see 10 ACTION AND CLINICAL PHARMACOLOGY).

**Renal Impairment:** No dosage modification is recommended in patients with mild to moderate renal impairment (CrCl ≥ 30 mL/min, estimated by Cockcroft-Gault). Monitor for BRUKINSA adverse reactions in patients with severe renal impairment (CrCl < 30 mL/min) or on dialysis.

**Hepatic Impairment:** No dose modification is recommended in patients with mild or moderate hepatic impairment.

The recommended dose of BRUKINSA for patients with severe hepatic impairment is 80 mg orally twice daily. The safety of BRUKINSA has not been evaluated in patients with severe hepatic impairment. Monitor closely for adverse reactions of BRUKINSA in patients with hepatic impairment.

**4.3 Administration**

BRUKINSA capsules should be swallowed whole with water, BRUKINSA can be taken with or without food. The capsule should not be chewed, dissolved, or opened. BRUKINSA must not be taken with grapefruit juice, grapefruit and/or Seville oranges.

**4.4 Missed Dose**

If a dose of BRUKINSA is not taken at the scheduled time, it can be taken as soon as possible on the same day with a return to the normal schedule the following day.
5  **OVERDOSAGE**

There is no specific treatment for BRUKINSA overdose. For patients who experience overdose closely monitor and provide appropriate supportive treatment.

For management of a suspected drug overdose, contact your regional poison control center.

6  **DOSAGE FORMS, STRENGTHS, COMPOSITION AND PACKAGING**

</tr>
</tbody>
</table>

**Description**
Size 0 hard gelatin capsule with a white to off-white opaque body and cap, marked in black ink with 'ZANU 80'.

**Packaging**
White high density polyethylene (HDPE) plastic bottle, capped with a child-resistant polypropylene closure containing 120 capsules.

7  **WARNINGS AND PRECAUTIONS**

Please see the 3 **SERIOUS WARNINGS AND PRECAUTIONS BOX** at the beginning of Part I: Health Professional Information.

**Carcinogenesis and Mutagenesis**

**Second Primary Malignancies**

Patients with a history of other active malignancies within 2 years of study entry (except those with curatively treated basal or squamous cell carcinoma, superficial bladder cancer, carcinoma in situ and other localized malignancy) were excluded from clinical trials with BRUKINSA. Serious and fatal second primary malignancies were reported in patients treated with BRUKINSA. Second primary malignancies, including non-skin carcinoma have occurred in 14% patients with hematological malignancies treated with BRUKINSA monotherapy. The most frequent second primary malignancy was skin cancer (basal cell carcinoma, squamous cell carcinoma of skin, and malignant melanoma), reported in 9% of patients. Monitor patients for skin cancer and advise patients to use sun protection.
Cardiovascular
Patients with active, clinically significant cardiovascular disease, such as uncontrolled arrhythmia, class 3 or 4 congestive heart failure or recent myocardial infarction, were excluded from clinical trials of BRUKINSA.

Atrial Fibrillation and Flutter
Atrial fibrillation and atrial flutter have occurred in 3% of patients with hematological malignancies treated with BRUKINSA monotherapy. This risk may be increased in patients with cardiac risk factors, hypertension, and acute infections. Grade 3 and above events were reported in 1% of patients. Monitor for signs and symptoms of atrial fibrillation and atrial flutter and manage as appropriate.

Driving and Operating Machinery
No specific studies have been conducted to evaluate the influence of BRUKINSA treatment on the ability to drive or operate heavy machinery. Fatigue, dizziness, and asthenia have been reported in some patients taking BRUKINSA and should be considered when assessing a patient’s ability to drive or operate machines.

Hematologic
Cytopenias
Patients with moderate and severe cytopenias were excluded from clinical trials with BRUKINSA. Grade 3 or 4 neutropenia* 23%, including febrile neutropenia, thrombocytopenia* (8%) and anemia* (8%) were reported in patients with hematologic malignancies treated with BRUKINSA monotherapy (see 8 ADVERSE REACTIONS). Monitor complete blood counts regularly during treatment (see Monitoring and Laboratory Tests). Reduce dose, interrupt or discontinue treatment as necessary (See 4 DOSAGE AND ADMINISTRATION) and treat using growth factors or transfusion as necessary.

*grouped terms

Immune
Infections
Patients with active fungal, bacterial, and/or viral infection requiring systemic therapy were excluded from clinical trials with BRUKINSA. Patients with documented HIV infection or active hepatitis B or hepatitis C infection were excluded from clinical trials with BRUKINSA.

Serious and fatal infections (including bacterial, viral, or fungal) and opportunistic infections have occurred in patients with hematological malignancies treated with BRUKINSA monotherapy. Infections (all grades) occurred in 74% patients, and Grade 3 or higher infections occurred in 27% of patients. The most common Grade 3 or higher infection was pneumonia*. Out of those patients who experienced an infection (74% of all treated), 20% of these patients had concurrent neutropenia. Twenty one percent (21%) of the patients who experienced neutropenia developed pneumonia*. Fatal infections (including COVID-19 pneumonia) occurred in 2.5% of patients. Infections due to hepatitis B virus (HBV) or varicella zoster reactivation (herpes zoster) have occurred.

Patients should be monitored for fever, neutropenia, and infection, and appropriate anti-infective therapy should be instituted as indicated. Consider prophylaxis according to standard of care in patients who are at increased risk for infections.

*(grouped term, including Covid-19 pneumonia)

Monitoring and Laboratory Tests
- Monitor complete blood counts as per routine clinical practice.
- Monitor for symptoms (e.g., palpitations, dizziness, syncope, chest pain, dyspnea) of atrial fibrillation and atrial flutter and obtain an echocardiogram (ECG) as appropriate.
- Monitor patients for the appearance of skin cancers.
- Monitor patients for signs and symptoms of infection and treat as medically appropriate.
- Monitor patients for signs of bleeding.

**Peri-Operative Considerations**
Patients with major surgery within 4 weeks of the first dose of study drug were excluded from clinical trials with BRUKINSA. Consider the benefit-risk of withholding BRUKINSA for 3 to 7 days pre- and post-surgery depending upon the type of surgery and the risk of bleeding.

**Reproductive Health: Female and Male Potential**

**Fertility**
No data on the effects of BRUKINSA on fertility in humans are available. No effects of zanubrutinib on fertility or reproductive capacities were observed in male or female rats, but at the highest dose tested, morphological abnormalities in sperm and increased post-implantation loss were noted. (see 16 NON-CLINICAL TOXICOLOGY, Reproductive and Developmental Toxicity).

**Teratogenic Risk**
BRUKINSA can cause harm to the developing fetus and loss of pregnancy (See 7.1.1 Pregnant Women). Advise women of the potential hazard to a fetus and to avoid becoming pregnant during treatment and for at least 1 week after the last dose of BRUKINSA. Pregnancy testing is recommended for females of reproductive potential prior to initiating BRUKINSA.

Advise men to avoid fathering a child while receiving BRUKINSA and for at least 3 months following the last dose of BRUKINSA.

**Respiratory**

**Interstitial Lung Disease (ILD)**
Patients with severe or debilitating pulmonary disease were excluded from clinical trials with BRUKINSA. Cases of suspected ILD have occurred in 2% of patients with hematological malignancies treated with BRUKINSA monotherapy. However, none were confirmed by biopsy. Monitor patients for signs and symptoms of ILD. Advise patients to report promptly any new or worsening respiratory symptoms. If ILD is suspected, interrupt BRUKINSA and treat promptly and appropriately. If ILD is confirmed, discontinue BRUKINSA.

**Vascular**

**Hemorrhage**
Patients with a history of severe bleeding disorder (hemophilia A, hemophilia B, von Willebrand disease), history of spontaneous bleeding requiring blood transfusion or other medical intervention were excluded from clinical trials with BRUKINSA. Serious and fatal hemorrhagic events have occurred in patients with hematological malignancies treated with BRUKINSA monotherapy. Grade 3 or higher bleeding events including intracranial and gastrointestinal hemorrhage, hematuria and hemothorax have been reported in 4% of patients treated with BRUKINSA monotherapy. Bleeding events of any grade, including purpura and petechiae, occurred in 54% of patients with hematological malignancies treated with BRUKINSA monotherapy.
BRUKINSA may increase the risk of hemorrhage in patients receiving antiplatelet or anticoagulant therapies. Patients were excluded from BRUKINSA studies if they had recent history of stroke or intracranial hemorrhage, or if they required warfarin or other vitamin K antagonists.

Patients should be monitored for signs of bleeding. Bleeding events should be managed with supportive measures, including transfusions, and specialized care as needed. Reduce dose, interrupt or discontinue treatment as necessary (See 4 DOSAGE AND ADMINISTRATION). For any intracranial hemorrhage, treatment should be discontinued.

7.1 Special Populations

7.1.1 Pregnant Women

There are no adequate and well-controlled studies of BRUKINSA in pregnant women. Based on findings in animals, zanubrutinib may cause fetal harm when administered to pregnant women (see 16 NON-CLINICAL TOXICOLOGY). Women of child-bearing potential must use highly effective contraceptive measures while taking BRUKINSA and at least for one week after stopping treatment. Women who use hormonal methods of birth control must add a barrier method. If BRUKINSA is used during pregnancy or if the patient becomes pregnant while taking BRUKINSA, the patient should be apprised of the potential hazard to the fetus.

7.1.2 Breast-feeding

It is unknown if BRUKINSA is excreted in human milk. Because many drugs are excreted in human milk and because of the potential for serious adverse reactions from BRUKINSA in a breastfed child, advise lactating women not to breastfeed during treatment with BRUKINSA and for at least two weeks following the last dose.

7.1.3 Pediatrics

Pediatrics (<18 years of age): The safety and efficacy of BRUKINSA in children and adolescents aged less than 18 years have not been established; therefore, Health Canada has not authorized an indication for pediatric use.

7.1.4 Geriatrics

Of the 847 patients in clinical trials of BRUKINSA, 53% were 65 years of age or older, and 20% were 75 years of age or older. No clinically relevant differences in safety or efficacy were observed between patients ≥65 years and those younger than 65 years.

8 ADVERSE REACTIONS

8.1 Adverse Reaction Overview

The overall safety profile of BRUKINSA is based on pooled data from 847 patients with B-cell malignancies treated with BRUKINSA in clinical trials.

The most common adverse reactions (≥ 10%) were neutropenia*, thrombocytopenia*, upper
respiratory tract infection, anemia*, rash*, musculoskeletal pain*, diarrhea, cough, contusion, pneumonia*, urinary tract infection, hemorrhage*, and hematuria.

Overall, 21% of patients experienced serious adverse reactions. The most frequently reported serious adverse reactions (≥ 2%) were pneumonia* (12%), neutropenia* (3%) and hemorrhage* (2%).

Deaths due to adverse reactions within 30 days of the last dose were reported in 2% of patients. The most common treatment-emergent adverse reactions leading to death was pneumonia* (1%).

Of the 847 patients treated with BRUKINSA, 30 (4%) patients discontinued treatment due to adverse reactions. The most frequent adverse reaction leading to treatment discontinuation was pneumonia* (2%). Adverse reactions leading to dose reduction occurred in 4% of patients. The most frequent adverse reaction leading to dose reduction was neutropenia* (1%).

*Includes multiple preferred terms.

8.2 Clinical Trial Adverse Reactions

Because clinical trials are conducted under very specific conditions, the adverse reaction rates observed in the clinical trials may not reflect the rates observed in practice and should not be compared to the rates in the clinical trials of another drug. Adverse reaction information from clinical trials is useful for identifying drug-related adverse events and for approximating rates.

Waldenström’s Macroglobulinemia (WM)

The safety of BRUKINSA was evaluated in relapsed/refractory (RR) or treatment-naïve WM patients with MYD88 mutation (MYD88<sup>MUT</sup>) in a Phase 3, randomized, open-label clinical trial, BGB-3111-302, that included 101 patients treated with BRUKINSA at a dose of 160 mg twice daily and 98 patients treated with ibrutinib (Cohort 1). Additionally, 28 patients with RR or treatment-naïve WM found to have MYD88 wildtype (MYD88<sup>WT</sup>) (N=26) or missing/inconclusive MYD88 status (N=2) were treated with BRUKINSA in a non-randomized exploratory arm (Cohort 2).

In Cohort 1, the median duration of treatment was 18.7 months in the BRUKINSA arm and 18.6 months in the ibrutinib arm. In Cohort 2, the median duration of treatment was 16.4 months.

Serious treatment-emergent adverse events occurred in 40% of patients in the BRUKINSA arm. The most frequent serious adverse events were febrile neutropenia, influenza, and neutropenia (3% each); and anaemia, basal cell carcinoma, lower respiratory tract infection, pleural effusion, pyrexia, sepsis, and thrombocytopenia (2% each).

Of the 101 patients randomized and treated with BRUKINSA, 4% patients discontinued due to adverse events. The events leading to discontinuation were cardiomegaly, neutropenia, plasma cell myeloma, and subdural hemorrhage (1% each). Adverse events leading to dose reduction occurred in 14% of patients. The most common adverse events leading to dose reduction were neutropenia (3%) and diarrhea (2%).

Death due to adverse events within 30 days of last dose occurred in 1 (1%) patient. The adverse event leading to death was cardiomegaly.
Table 4 summarizes treatment emergent adverse events in patients randomized in Cohort 1 in BGB-3111-302.

Table 4: Treatment-Emergent Adverse Events in ≥ 10% (All Grades*) of Patients with WM in BRUKINSA or Ibrutinib Arm of Cohort 1 in BGB-3111-302 Trial

* Grades were evaluated based on the National Cancer Institute Common Terminology Criteria for Adverse Events (NCI-CTCAE) version 4.03.

§ Includes multiple preferred terms:
Bruising includes all related terms containing bruise, bruising, contusion, ecchymosis.
Hemorrhage includes all related terms containing hemorrhage, hematoma.
Musculoskeletal pain includes musculoskeletal pain, musculoskeletal discomfort, myalgia, back pain, arthralgia, arthritis.
Pneumonia includes pneumonia, pneumonia fungal, pneumonia cryptococcal, pneumonia streptococcal, atypical pneumonia, lung infection, lower respiratory tract infection, lower respiratory tract infection bacterial, lower respiratory tract infection viral.
Rash includes all related terms containing rash.

The safety profile of BRUKINSA in patients with WM in the non-randomized Cohort 2 (MYD88WT or missing/inconclusive MYD88 status, N = 28) was generally consistent with the safety profile for BRUKINSA in Cohort 1.

**Mantle Cell Lymphoma (MCL)**

The safety of BRUKINSA was evaluated in 118 patients with MCL who received at least one prior therapy at a dose of 320 mg daily in two single-arm clinical trials, BGB-3111-206 and BGB-3111-AU-003. The median duration of treatment was 22.8 months.
Serious treatment-emergent adverse events occurred in 33.9% of patients. The most frequent (≥ 2% of patients) serious adverse events were lung infection (6.8%), pneumonia (4.2%), and anaemia (2.5%).

Of the 118 patients treated with BRUKINSA, 13.6% patients discontinued treatment due to adverse events. The most frequent adverse events leading to treatment discontinuation was pneumonia* (3.4%). Adverse events leading to dose reduction occurred in 3.4% of patients; these included hepatitis B, neutropenia, allergic dermatitis, and peripheral sensory neuropathy (in 1 patient each).

*grouped term

Death due to adverse events within 30 days of last dose occurred in 9 (7.6%) patients. The adverse events leading to death were road traffic accident, cerebral hemorrhage, cerebral infarction, congestive cardiac failure, pneumonia* (in 2 patients) and unknown reason (in 3 patients).

*grouped terms

Table 5 summarizes treatment emergent adverse events in BGB-3111-206 and BGB-3111-AU-003.

- Pneumonia includes pneumonia, pneumonia fungal, pneumonia cryptococcal, pneumonia streptococcal, atypical pneumonia, lung infection, lower respiratory tract infection, lower respiratory tract infection bacterial, lower respiratory tract infection viral.
- Rash includes all related terms containing rash.
- Upper respiratory tract infection includes PTs of upper respiratory tract infection and viral upper respiratory tract infection.

**Marginal Zone Lymphoma (MZL)**

The safety of BRUKINSA was evaluated in patients with RR marginal zone lymphoma in two open-label clinical trials, BGB-3111-214 (n=68) and BGB-3111-AU-003 (n=20) that included 88 patients treated with BRUKINSA at a dose of 160 mg twice daily. The median duration of treatment was 15 months.

Serious treatment-emergent adverse events were reported in 35 (40%) patients. The most frequent serious adverse events (≥ 2% of patients) were pyrexia (8%), pneumonia* (7%), influenza (2%), anemia (2%), diarrhoea (2%), atrial fibrillation and flutter (2%) and fall (2%).

*(grouped term, including Covid-19 pneumonia)
Of the 88 patients with MZL treated with BRUKINSA, 5 (6%) patients discontinued treatment due to adverse event. The adverse events leading to treatment discontinuation included 2 cases of pneumonia (due to COVID-19 pneumonia), 1 case each of pyrexia, myocardial infarction and diarrhea. Two (2%) patients had a dose reduction due to adverse events. Death due to adverse events within 30 days of last dose occurred in 3 (3%) patients. The adverse events leading to death were: COVID-19 pneumonia in 2 patients (2%) and myocardial infarction in 1 patient (1%).

Table 6 summarizes adverse events in patients in BGB-3111-214 and BGB-3111-AU-003.

Table 6: Treatment-Emergent Adverse Events in ≥ 10% (All Grades) of Patients with MZL treated with BRUKINSA in BGB-3111-214 and BGB-3111-AU-003 Trials

* Grades were evaluated based on the National Cancer Institute Common Terminology Criteria for Adverse Events (NCI-CTCAE) version 4.03.

Bruising includes preferred terms (PTs): contusion, ecchymosis, Increased tendency to bruise, post procedural contusion.

Hemorrhage includes all related terms containing hemorrhage, hematoma.

Musculoskeletal pain includes musculoskeletal pain, musculoskeletal discomfort, myalgia, back pain, arthralgia.

Pneumonia includes PTs: pneumonia, lower respiratory tract infection, COVID-19 pneumonia, organising pneumonia.

Rash includes all related terms containing rash.

Upper respiratory tract infection includes PTs of upper respiratory tract infection and viral upper respiratory tract infection.

8.3 Less Common Clinical Trial Adverse Reactions

Waldenström’s Macroglobulinemia (WM)

The following treatment-emergent adverse events (regardless of causality) have been reported in the zanubrutinib arm of Cohort 1 of the BGB-3111-302 trial in more than 2 patients (adverse events addressed in Section 8.2 and laboratory abnormalities not included).

Blood and lymphatic system disorders: increased tendency to bruise

Cardiac disorders: palpitations, sinus bradycardia

Ear and labyrinth disorders: tinnitus

Eye disorders: vision blurred

Gastrointestinal disorders: abdominal pain, angina bullosa haemorrhagica, dry mouth, dyspepsia, gastroesophageal reflux disease, stomatitis

General disorders and administration site conditions: asthenia, chest pain, gait disturbance

Investigations: weight decreased

Metabolism and nutrition disorders: decreased appetite, dehydration

Musculoskeletal and connective tissue disorders: joint swelling, muscular weakness

Nervous system disorders: peripheral sensory neuropathy, syncope

Psychiatric disorders: depression

Renal and urinary disorders: nocturia, urinary retention

Respiratory, thoracic and mediastinal disorders: pleural effusion

Skin and subcutaneous tissue disorders: hyperhidrosis, petechiae, pruritus, purpura, skin lesion, skin ulcer

Mantle Cell Lymphoma (MCL)

The following treatment-emergent adverse events (regardless of causality) have been reported at a frequency of <10% (more than 2 patients) in previously treated MCL patients who received a dose of 320 mg daily in BGB-3111-206 and BGB-3111-AU-003 trials.

Renal and urinary disorders: hematuria
Infections and Infestations: localized infection

Gastrointestinal disorders: nausea

Musculoskeletal and connective tissue disorders: muscle spasms

Respiratory, thoracic and mediastinal disorders: dyspnea

General disorders and administration site conditions: fatigue, oedema peripheral

Skin and subcutaneous tissue disorders: pruritus

Nervous system disorders: dizziness

Metabolism and nutrition disorders: hyperuricaemia

Marginal Zone Lymphoma (MZL)
The following less common adverse events (all grades) have been reported in more than 2 patients with zanubrutinib in the BGB-3111-214 and BGB-3111-AU-003 trials.

Blood and lymphatic system disorders: anaemia

Gastrointestinal disorders: abdominal pain upper, gastrooesophageal reflux disease, vomiting, stomatitis

Infections and infestations: nasopharyngitis, urinary tract infection, oral herpes, sinusitis, conjunctivitis, cystitis, escherichia urinary tract infection, skin infection, tonsillitis

Investigations: alanine aminotransferase increased

Metabolism and nutrition disorders: hypokalaemia, decreased appetite

Musculoskeletal and connective tissue disorders: muscle spasms, pain in extremity

General disorders and administration site conditions: oedema peripheral, asthenia, chills, influenza like illness

Skin and subcutaneous tissue disorders: petechiae, purpura

Injury, poisoning and procedural complications: fall, skin laceration

Nervous system disorders: dizziness, lethargy, paraesthesia, headache

Psychiatric disorders: insomnia, anxiety

Respiratory, thoracic and mediastinal disorders: cough, epistaxis, dysphonia, dyspnoea, productive cough

Renal and urinary disorders: hematuria

9 DRUG INTERACTIONS

9.1 Overview

Zanubrutinib is primarily metabolized by CYP3A. Concomitant use of BRUKINSA with medicinal products that strongly or moderately inhibit CYP3A can increase zanubrutinib plasma concentrations, which may increase the risk of BRUKINSA toxicities.

Concomitant use of BRUKINSA with moderate or strong CYP3A inducers can decrease zanubrutinib plasma concentrations, which may reduce BRUKINSA efficacy.

9.2 Drug-Drug Interactions

The drugs listed in Table 10 are based on either drug interaction studies, or potential interactions due to the expected magnitude and seriousness of the interaction.
Table 10: Drug-Drug Interactions

</table>

CT = Clinical Trial; P = Predicted
Clinical Studies

**Effects of Gastric Acid Reducing Agents on zanubrutinib:** No clinically significant differences in zanubrutinib pharmacokinetics were observed when co-administered with gastric acid reducing agents (proton pump inhibitors, H2-receptor antagonists).

**Effects of zanubrutinib on CYP3A Substrates:** Co-administration of multiple doses of zanubrutinib decreased midazolam (CYP3A substrate) $C_{\text{max}}$ by 30% and AUC by 47%.

**Effects of zanubrutinib on CYP2C19 Substrates:** Co-administration of multiple doses of zanubrutinib decreased omeprazole (CYP2C19 substrate) $C_{\text{max}}$ by 20% and AUC by 36%.

**Effects of zanubrutinib on Other CYP Substrates:** No clinically significant differences were observed with warfarin (CYP2C9 substrate) pharmacokinetics or predicted with rosiglitazone (CYP2C8 substrate) pharmacokinetics when co-administered with zanubrutinib.

**Effects of zanubrutinib on Transporter Systems:** Co-administration of multiple doses of zanubrutinib increased digoxin (P-gp substrate) $C_{\text{max}}$ by 34% and AUC by 11%. No clinically significant differences in the pharmacokinetics of rosuvastatin (BCRP substrate) were observed when co-administered with zanubrutinib.

In Vitro Studies

**Effects of zanubrutinib on CYP2B6 Substrates:** In vitro, zanubrutinib is a weak inducer of CYP2B6.

**Effects of Transporters on zanubrutinib:** In vitro, zanubrutinib is likely to be a substrate of P-gp. Zanubrutinib is not a substrate or inhibitor of OAT1, OAT3, OCT2, OATP1B1, or OATP1B3.

9.3 Drug-Food Interactions

Avoid concomitant use with grapefruit, grapefruit juice and Seville oranges, as they contain inhibitors of CYP3A and may increase zanubrutinib plasma concentrations.

No clinically significant differences in zanubrutinib AUC or $C_{\text{max}}$ were observed following administration of a high-fat meal (approximately 1,000 calories with 50% of total caloric content from fat) in healthy subjects.

9.4 Drug-Herb Interactions

Avoid St. John’s wort which may unpredictably decrease zanubrutinib plasma concentrations.

10 ACTION AND CLINICAL PHARMACOLOGY

10.1 Mechanism of Action

Zanubrutinib is a small-molecule inhibitor of BTK. Zanubrutinib forms a covalent bond with a cysteine residue in the BTK active site, leading to inhibition of BTK activity. BTK is a signaling molecule of the B-cell antigen receptor (BCR) and cytokine receptor pathways. In B-cells, BTK signaling results in activation of pathways necessary for B-cell proliferation, trafficking, chemotaxis, and adhesion.
In nonclinical studies, zanubrutinib inhibited malignant B-cell proliferation and reduced tumor growth.

10.2 Pharmacodynamics

BTK occupancy in peripheral blood mononuclear cells and lymph node biopsies

The median steady-state BTK occupancy in peripheral blood mononuclear cells was maintained at 100% over 24 hours at a total daily dose of 320 mg BRUKINSA in patients with B-cell malignancies. The median steady-state BTK occupancy in lymph nodes was 94% and 100% following the approved recommended dosage of 320 mg once daily, or 160 mg twice daily respectively.

Cardiac electrophysiology

At the approved recommended doses (320 mg once daily or 160 mg twice daily), there were no clinically relevant effects on the QTc interval. In a thorough QT study in healthy subjects, a single dose of 160mg or 480 mg zanubrutinib did not prolong the QT interval to any clinically relevant extent. The maximum plasma exposure of zanubrutinib in this study was close to the maximum plasma exposure observed in patients following the recommended dose of 320 mg once daily.

The effect of BRUKINSA on the QTc interval above the therapeutic exposure has not been evaluated.

10.3 Pharmacokinetics

The pharmacokinetics (PK) of zanubrutinib were studied in healthy subjects and patients with B-cell malignancies. Zanubrutinib maximum plasma concentration (C_max) and area under the plasma drug concentration over time curve (AUC) increase proportionally over a dosage range from 40 mg to 320 mg (0.13 to 1 time the recommended total daily dose). Limited systemic accumulation of zanubrutinib was observed following repeated administration.

The geometric mean (%CV) zanubrutinib steady-state daily AUC is 2,099 (42%) ng·h/mL following a 160 mg twice daily dose and 1,917 (59%) ng·h/mL following a 320 mg once daily dose. The geometric mean (%CV) zanubrutinib steady-state C_max is 299 (56%) ng/mL following a 160 mg twice daily dose and 533 (55%) ng/mL following a 320 mg once daily dose.

Absorption: The median T_max of zanubrutinib is 2 hours.

Food effect: No clinically significant differences in zanubrutinib AUC or C_max were observed following administration of a high-fat meal (approximately 1,000 calories with 50% of total caloric content from fat) in healthy subjects.

Distribution: The geometric mean (%CV) apparent steady-state volume of distribution of zanubrutinib during the terminal phase (Vz/F) was 522 L (71%) following a 160 mg twice daily dose. The plasma protein binding of zanubrutinib is approximately 94% and the blood-to-plasma ratio is 0.7 to 0.8.

Metabolism: In vitro, zanubrutinib is primarily metabolized by cytochrome P450(CYP)3A.
**Elimination:** The mean half-life (t½) of zanubrutinib is approximately 2 to 4 hours following a single oral zanubrutinib dose of 160 mg or 320 mg. The geometric mean (%CV) apparent oral clearance (CL/F) of zanubrutinib during the terminal phase was 128 (61%) L/h.

Following a single radiolabeled zanubrutinib dose of 320 mg to healthy subjects, approximately 87% of the dose was recovered in feces (38% unchanged) and 8% in urine (less than 1% unchanged).

**Special Populations and Conditions**

Based on population PK analysis, age (19 to 90 years), sex, race (Caucasian, Asian, and others), and body weight (36 to 144 kg) did not have clinically meaningful effects on the PK of zanubrutinib.

**Pediatrics:** No pharmacokinetic studies were performed with zanubrutinib in patients under 18 years of age.

**Hepatic Insufficiency:** The total AUC of zanubrutinib increased by 11% in subjects with mild hepatic impairment (Child-Pugh class A), by 21% in subjects with moderate hepatic impairment (Child-Pugh class B), and by 60% in subjects with severe hepatic impairment (Child-Pugh class C) relative to subjects with normal liver function. The unbound AUC of zanubrutinib increased by 23% in subjects with mild hepatic impairment (Child-Pugh class A), by 43% in subjects with moderate hepatic impairment (Child-Pugh class B), and by 194% in subjects with severe hepatic impairment (Child-Pugh class C) relative to subjects with normal liver function.

**Renal Insufficiency:** Zanubrutinib undergoes minimal renal elimination. Based on population PK analysis, mild and moderate renal impairment (CrCl ≥ 30 mL/min as estimated by Cockcroft-Gault equation) had no influence on the exposure of zanubrutinib. Limited PK data is available in patients with severe renal impairment (CrCl < 30 mL/min) or in patients requiring dialysis.

11 **STORAGE, STABILITY AND DISPOSAL**

Store BRUKINSA at room temperature, between 15°C-30°C, in the original bottle.

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

12 **SPECIAL HANDLING INSTRUCTIONS**

Not applicable.
PART II: SCIENTIFIC INFORMATION

13 PHARMACEUTICAL INFORMATION

Drug Substance

Proper name: zanubrutinib

Chemical name: ((7S)-2-(4-phenoxyphenyl)-7-[1-(prop-2-enoyl) piperidin-4-yl]-4,5,6,7-tetrahydropyrazolo[1,5-a] pyrimidine-3-carboxamide)

Molecular formula and molecular mass: $C_{27}H_{29}N_{5}O_{3}$ and 471.55

Structural formula:

Physicochemical properties: Zanubrutinib is a crystalline white to off-white powder. The solubility of zanubrutinib is pH dependent, from very slightly soluble to practically insoluble in aqueous solutions.

14 CLINICAL TRIALS

14.1 Clinical Trials by Indication

The Treatment Of Adult Patients With Waldenström's Macroglobulinemia (WM)

The safety and efficacy of BRUKINSA were evaluated in a randomized, open-label, multi-center study comparing BRUKINSA and ibrutinib in 201 patients with MYD88 mutated ($MYD88^{MUT}$) WM (BGB-3111-302). In addition, a subset of WM patients found to have $MYD88$ wildtype ($MYD88^{WT}$) by gene sequencing (N=26), or whose mutational status was missing or inconclusive (N=2), were enrolled in a third, non-randomized study arm (Table 11).

</table>

Eligible patients were at least 18 years of age with a clinical and definite histological diagnosis of relapsed/refractory (RR) WM or treatment-naïve and considered to be unsuitable for standard chemo-immunotherapy regimens. Patients had to meet at least one criterion for treatment according to consensus panel criteria from the Seventh International Workshop on Waldenström’s Macroglobulinemia (IWWM-7) and have measurable disease, as defined by a serum IgM level > 0.5 g/dl. Patients with MYD88 mutation (MYD88MUT) were assigned to Cohort 1 (N = 201) and were randomized 1:1 to receive either BRUKINSA 160 mg twice daily (Arm A) or ibrutinib 420 mg once daily (Arm B) until disease progression or unacceptable toxicity. Subjects found to have MYD88 wildtype (MYD88WT) by centrally confirmed gene sequencing (estimated to be present in approximately 10% of enrolled subjects), were enrolled to Cohort 2 (N = 26) and received BRUKINSA 160 mg twice daily on a third, non-randomized, study arm (Arm C). In addition, those subjects whose MYD88 mutational status was missing or inconclusive (N = 2) were assigned to Cohort 2, Arm C.

In Cohort 1, the median age was 70 years (range, 38 to 90 years), 28% were > 75 years (22% on the ibrutinib arm, 33% on the BRUKINSA arm), 67% were male, and 91% were Caucasian. At study entry, patients had an International Prognostic Scoring System (IPSS) high, derived using M-protein by serum protein electrophoresis (SPEP), as follows: 44% of patients in the ibrutinib arm and 46% of patients in the BRUKINSA arm. Ninety-four percent of patients had a baseline ECOG performance status of 0 or 1, and 6% had a baseline ECOG performance status of 2. The median time from initial diagnosis was 4.6 years. Overall, 74 (37%) patients had IgM levels ≥ 40 g/L. One-hundred-sixty-four patients (82%) had RR WM. The median number of prior therapies was 1 (range, 1 to 8), and median time from initial diagnosis was 5.6 years.
Patient disposition and demographics of patients with RR WM in Cohort 1 were generally similar between BRUKINSA and ibrutinib arms except pertaining to age. Compared with the ibrutinib treatment arm, the BRUKINSA treatment arm had a higher proportion of patients ≥ 75 years of age (32.5% versus 19.8%) and < 65 years of age (43.4% versus 32.1%).

In Cohort 2, the median age was 72 years (range, 39 to 87), 43% were > 75 years, 50% were male, and 96% were Caucasian. At study entry, 43% of the patients had an IPSS high (derived using M-protein by SPEP). Baseline ECOG performance status score was 0 or 1 in 86% of patients and 14% had a baseline ECOG performance status of 2. The median times from initial diagnosis was slightly shorter than in Cohort 1 (median 3.7 years versus 4.6 years). Eight (29%) patients in Cohort 2 had IgM levels ≥ 40 g/L. Twenty-three of the 28 patients (82%) in Cohort 2 had RR disease, with a median number of prior therapies of 1 (range, 1 to 5).

Patient disposition and demographics of RR WM MYD88WT patients were similar to those of RR WM MYD88MUT patients in Cohort 1 except that RR WM MYD88WT patients had a median of 4.0 years from initial diagnosis which was shorter than the median of 5.6 years for RR WM MYD88MUT patients from Cohort 1.

The primary outcome measure was rate of Complete Response (CR) or Very Good Partial Response (VGPR), in RR MYD88MUT as assessed by Independent Review Committee (IRC) with adaptation of the response criteria updated at the Sixth IWWM. The secondary endpoints for Cohort 1 included major response rate (MRR), duration of response, rate of CR or VGPR assessed by investigator, and progression-free survival (PFS).

The primary efficacy analysis for patients with RR WM with MYD88 mutation (MYD88MUT), Cohort 1, was conducted at a median follow-up of 18.8 months in study BGB-3111-302 (ASPEN). As per IRC assessment, the primary study results failed to reach statistical significance in the RR Analysis Set (2-sided p = 0.12), thus the study did not meet the primary efficacy endpoint (Table 12). Consequently, all other endpoints are considered descriptive. Efficacy results, as assessed by Investigator, were consistent with the primary efficacy analysis.

Abbreviations: CR, complete response; IRT, Interactive Response Technology; ITT, intent to treat; MR, minor response; MRR, major response rate; NE, not evaluable; ORR, overall response rate; PD, progressive disease; PR, partial response; SD, stable disease; VGPR, very good partial response
Cohort 1 includes patients with activating mutations in MYD88.

Percentage are based on N.
a 95% CI is calculated using the Clopper-Pearson method.
b Mantel-Haenszel common risk difference with the 95% CI calculated using a normal approximation and Sato’s standard error stratified by the stratification factors per IRT (strata CXCR4 WT and unknown are combined) and age group (≤ 65 and > 65 years). Ibrutinib is the reference group.
c Based on Cochran-Mantel-Haenszel test stratified by the stratification factors per IRT (strata CXCR4 WT and unknown are combined) and age group (≤ 65 and > 65 years). The p-value is 2-sided.

MRRs were 78% (95%CI: 68, 87) and 80% (95%CI: 70, 88) in the BRUKINSA and ibrutinib arms of the primary efficacy set (RR MYD88MUT patients), respectively. MRRs for treatment naive patients were 74% (95% CI: 49, 91) and 67% (95% CI: 41, 87) in the BRUKINSA and the ibrutinib arms, respectively.

Median DoR of CR or VGPR and PFS were not reached in either arm of the primary efficacy set of RR MYD88MUT WM patients.

In the non-randomized exploratory subset of BRUKINSA-treated MYD88WT WM patients (Cohort 2), VGPR or CR rates as assessed by IRC were 20% (95% CI: 1, 72) for treatment-naïve patients (n=5) and 29% (95% CI: 11, 52), for RR patients (n=21). No CRs were observed.

**The Treatment Of Adult Patients With Mantle Cell Lymphoma (MCL) Who Have Received At Least One Prior Therapy**

The safety and efficacy of BRUKINSA in patients with MCL were evaluated in an open-label, multi-center, single-arm Phase 2 study (BGB-3111-206) of 86 previously treated patients, and an open-label, dose escalation and expansion, global, multi-center, single arm Phase 1/2 study (BGB-3111-AU-003) of 32 previously treated patients (Table 13).
In Study BGB-3111-206, the median age of patients was 60.5 years (range 34 to 75) and the majority were male (77.9%). The median time since diagnosis was 2.5 years (range: 0.3, 8.5) and the median number of prior therapies was 2 (range 1 to 4). The most common prior regimens were CHOP-based (90.7%) followed by rituximab-based (74.4%). The study excluded patients with prior allogeneic hematopoietic stem cell transplant or prior exposure to a BTK inhibitor. The majority of patients had extranodal involvement (70.9%) and refractory disease (52.3%). Blastoid variant of MCL was present in 14% of patients. The MIPI score (which includes age, ECOG score, baseline lactate dehydrogenase, and WBC count) was intermediate in 29% and high risk in 13%.

Tumor response was according to the 2014 Lugano Classification and the primary efficacy endpoint was overall response rate as assessed by an Independent Review Committee. Duration of response (DoR) was a secondary endpoint.

In Study BGB-3111-AU-003, the median age of patients was 70.5 years (range 42 to 86), and 37.5% of patients were ≥75 years old. The majority of patients were male (68.8%). The median time since diagnosis was 4.5 years (range: 0.3, 14.5) and the median number of prior therapies was 1 (range 1 to 4). The most common prior regimens were rituximab-based (93.8%) followed by CHOP-based regimen (59.4%). MCL patients who received prior treatment with a BTK inhibitor or who received allogeneic stem cell transplantation within 6 months prior to enrollment were excluded from this study. The majority of patients had extranodal involvement (78.1%), and 25% had refractory disease. The MIPI score (which includes age, ECOG score, baseline lactate dehydrogenase and WBC count) was intermediate in 40.6% and high risk in 31.3%.
Tumor response was according to the 2014 Lugano Classification and the primary efficacy endpoint was overall response rate as assessed by an Independent Review Committee. PET scans were not required per protocol, and most responses were assessed using CT imaging. Duration of response (DoR) was a secondary endpoint.

For study BGB-3111-206 the efficacy analysis was conducted at a median follow-up of 18.5 months. At the time of analysis, 70% of patients remained on study. The independent review committee (IRC) assessed overall response rate (ORR) was 83.7% with a median duration of response (DoR) of 19.5 months (Table 14). The efficacy analysis was also conducted at a median follow-up of 24.8 months. At time of analysis, 66.3% of patients remained on study. The investigator assessed ORR was 83.7% (95% CI: 74.2, 90.8) with a CR rate of 77.9% and a PR rate of 5.8%. The median DoR was 24.9 months (95%CI: 23.1, NE).

For study BGB-3111-AU-003 the efficacy analysis was conducted at a median follow-up of 18.8 months. At time of analysis, 53.1% of patients remained on study. The IRC assessed ORR was 84.4% with a median DoR of 18.5 months (Table 14).

The Treatment of Adult Patients With Marginal Zone Lymphoma (MZL)

The efficacy of BRUKINSA was assessed in Study BGB-3111-214, a Phase 2 open-label, multicenter, single-arm trial of 68 previously treated patients with MZL who had received at least one prior anti-CD20-based therapy. Twenty-six (38.2%) patients had extranodal MZL, 26 (38.2%) had nodal MZL, 12 (17.6%) had splenic MZL, and 4 (6%) patients had unknown subtype. BRUKINSA was given orally at a dose of 160 mg twice daily until disease progression or unacceptable toxicity. The median age of patients was 70 years (range: 37 to 95), and 53% were male. The median time since initial diagnosis was 61.5 months (range: 2.0 to 353.6). The median number of prior treatments was 2 (range: 1 to 6). Twenty-two (32.4%) patients had refractory disease at study entry.

The efficacy of BRUKINSA was also assessed in BGB-3111-AU-003, an open-label, multicenter, single-arm trial that included 20 patients with previously treated MZL (45% having extranodal MZL, 25% nodal, 30% splenic). BRUKINSA was given orally at dosages of 160 mg twice daily or 320 mg once daily. The median age was 70 years (range: 52 to 85); 50% were
male. The median number of prior systemic therapies was 2 (range: 1 to 5), with 20% having 3 or more lines of systemic therapy; 95% had prior rituximab-based chemotherapy.

In both studies, MZL patients who received prior treatment with a BTK inhibitor and those with known CNS involvement or transformation to aggressive lymphoma were excluded. The primary efficacy endpoint was overall response rate as assessed by an Independent Review Committee (IRC). Tumor response was assessed according to the 2014 Lugano Classification. The efficacy results by IRC are summarized below and presented in Table 15.

*Two patients in BGB-3111-214 were not evaluable for efficacy due to central confirmation of MZL transformation to diffuse large B-cell lymphoma.

In BGB-3111-214, the median time to response was 2.8 months (range: 1.7 to 11.1 months). The overall response rates were 64%, 76%, 67%, and 50% for the MZL subtypes (extranodal, nodal, splenic, unknown subtype), respectively.

15 MICROBIOLOGY

Not Applicable

16 NON-CLINICAL TOXICOLOGY

General Toxicology

The general toxicologic profiles of zanubrutinib were characterized via oral treatment in Sprague-Dawley rats for up to 6 months and in Beagle dogs for up to 9 months.

In the 6-month study, rats were dosed 30, 100 or 300 mg/kg/day for 182 days, or 1000 mg/kg/day for up to 8 days. The test article related mortality was only noted at the dose of 1000 mg/kg/day following 5-day treatment and the main toxicology findings was gastrointestinal tract toxicity associated with histopathologic changes. Test article related histopathologic changes were noted in pancreas, lung, and skeletal muscle most of which were fully or partially reversible. The NOAEL was considered to be 300 mg/kg/day, where the systemic exposure (AUC) was approximately 25 times in males and 42 times in females of the human exposure at the recommended dose.

In the 9-month study, dogs were dosed 10, 30 or 100 mg/kg/day for 273 days. No mortality occurred throughout the study. The toxicology findings or changes were minimal or mild and
resolved during recovery phase, including abnormal stool, conjunctiva hyperemia, lymphoid
depletion or erythrophagocytosis in the gut-associated lymphoid tissues. The NOAEL was
considered to be 100 mg/kg/day, where the systemic exposure (AUC) was approximately 20
times in males and 18 times in females of the human exposure at the recommended dose.

**Carcinogenicity**
Carcinogenicity studies have not been conducted with zanubrutinib.

**Genotoxicity**
Zanubrutinib was not mutagenic in a bacterial mutagenicity (Ames) assay, was not clastogenic
in a chromosome aberration assay in mammalian (CHO) cells, nor was it clastogenic in an in
vivo bone marrow micronucleus assay in rats.

**Developmental and Reproductive Toxicity**
A combined male and female fertility and early embryonic development study was conducted in
rats at oral zanubrutinib doses of 30 to 300 mg/kg/day. Male rats were dosed 4 weeks prior to
mating and through mating and female rats were dosed 2 weeks prior to mating and to gestation
day 7. No effect on male or female fertility was noted but at the high dose of 300 mg/kg day,
morphological abnormalities in sperm and increased post-implantation loss were noted. The
high dose of 300 mg/kg/day is approximately 9 times the human recommended dose, based on
body surface area.

Embryo-fetal development toxicity studies were conducted in both rats and rabbits. Zanubrutinib
was administered orally to pregnant rats during the period of organogenesis at doses of 30, 75,
and 150 mg/kg/day. Malformations in the heart (2- or 3-chambered hearts) were noted at all
dose levels (incidence between 0.3% and 1.5%) in the absence of maternal toxicity. The lowest
dose of 30 mg/kg/day is approximately 5 times the exposure (AUC) in patients receiving the
recommended dose.

Administration of zanubrutinib to pregnant rabbits during the period of organogenesis at 30, 70,
and 150 mg/kg/day resulted in post-implantation loss at the highest dose. The dose of 150
mg/kg is approximately 33 times the exposure (AUC) in patients at the recommended dose and
was associated with maternal toxicity.

In a pre- and post-natal developmental toxicity study in rats, zanubrutinib was administered
orally at 30, 75, and 150 mg/kg/day from implantation through weaning. The offspring from the
75 mg/kg/day and 150 mg/kg/day groups had decreased body weights preweaning, and all dose
groups had adverse ocular findings (e.g. cataract, protruding eye). The dose of 30 mg/kg/day is
approximately 4 times the AUC in patients receiving the recommended dose.
READ THIS FOR SAFE AND EFFECTIVE USE OF YOUR MEDICINE

PATIENT MEDICATION INFORMATION

Pr
BRUKINSA®
zanubrutinib capsules

Read this carefully before you start taking BRUKINSA and each time you get a refill. This leaflet is a summary and will not tell you everything about this drug. Talk to your healthcare professional about your medical condition and treatment and ask if there is any new information about BRUKINSA.

Serious Warnings and Precautions

- Take BRUKINSA only under the care of a doctor who is experienced in the use of anti-cancer drugs.
- **Hemorrhage (serious or fatal bleeding problems)** may occur when you take BRUKINSA. This can be bleeding a lot, or bleeding that is difficult to stop. Your risk of bleeding is increased when taking BRUKINSA with blood thinner medications or other medications that prevent blood clots.

What is BRUKINSA used for?
BRUKINSA is used to treat cancers such as:
- Waldenström’s Macroglobulinemia (WM).
- Mantle Cell lymphoma (MCL). BRUKINSA is only used in patients who already have received at least one treatment for MCL.
- Marginal Zone Lymphoma (MZL). BRUKINSA is used in patients who have received at least one previous antibody (anti-CD20) therapy against their cancer.

How does BRUKINSA work?
BRUKINSA blocks a specific protein in the body that helps cancer cells live and grow. This protein is called “Bruton's Tyrosine Kinase.” By blocking this protein, BRUKINSA may help kill and reduce the number of cancer cells and slow the spread of the cancer.

What are the ingredients in BRUKINSA?
Medicinal ingredients: zanubrutinib
Non-medicinal ingredients: ammonium hydroxide (trace), colloidal silicon dioxide, croscarmellose sodium, dehydrated ethanol (trace), gelatin, iron oxide black (trace), isopropyl alcohol (trace), magnesium stearate, microcrystalline cellulose, n-butyl alcohol (trace), propylene glycol (trace), purified water (trace), shellac glaze in ethanol (trace), sodium lauryl sulphate, titanium dioxide.

BRUKINSA comes in the following dosage forms:
Capsules: 80 mg

Do not use BRUKINSA if:
- You are allergic to zanubrutinib or any other ingredients in BRUKINSA. If you are not sure about this, talk to your doctor before taking BRUKINSA.

To help avoid side effects and ensure proper use, talk to your healthcare professional before you take BRUKINSA. Talk about any health conditions or problems you may have,
including if you:
- have had recent surgery or plan to have surgery. Your healthcare provider may stop treatment with BRUKINSA for 3 to 7 days before or after a surgery. This includes any planned medical, surgical, or dental procedure.
- have or had heart rhythm problems. Your risk for heart rhythm problems is increased if you have or had heart problems, high blood pressure or acute infections. Speak to your doctor immediately if you have ever experienced any of the following: fast and/or irregular heartbeat, dizziness, chest pain, shortness of breath, or if you faint. Your doctor may monitor the condition of your heart during your treatment with BRUKINSA.
- have or had liver problems.
- have severe kidney disease or are on dialysis.

Other warnings you should know about:

Treatment with BRUKINSA can increase your risk of certain side effects, including:
- Interstitial lung disease: Lung diseases that inflame or scar lung tissue.
- New Cancers: New cancers have happened in people during treatment with BRUKINSA. This includes cancers of the skin or other organs. Use sun protection when you are outside in sunlight.
- Infections: Serious and fatal infections have been reported in patients who are treated with BRUKINSA. Taking BRUKINSA may increase your risk of developing the following infections
  - Pneumonia. Pneumonia is an infection deep in the lungs.
  - Hepatitis B infection. Hepatitis B infection is a viral infection in the liver.
  - Shingles. Shingles is due to a virus that causes a painful skin rash.

Pregnancy, breastfeeding and fertility

Female patients
If you are pregnant, able to get pregnant or think you are pregnant, there are specific risks you should discuss with your doctor.
- Avoid becoming pregnant while you are taking BRUKINSA. It may harm or cause death of your unborn baby.
- If you are able to become pregnant, your doctor will do a pregnancy test before you start treatment with BRUKINSA.
- Effective birth control methods should be used during treatment with BRUKINSA. Talk to your doctor about birth control methods that may be right for you. You should use appropriate birth control methods for at least one week after your final dose of BRUKINSA.
- If you are breastfeeding or plan to breastfeed. It is not known if BRUKINSA passes into your breast milk. Do not breastfeed during treatment with BRUKINSA and for 2 weeks after your final dose of BRUKINSA. Talk to your doctor about the best way to feed your baby during this time.

Male Patients
- Use highly effective birth control while you are on BRUKINSA and for at least 3 months after your last dose if your partner can get pregnant.

Children and adolescents
BRUKINSA is not for use in patients under 18 years of age.
Driving and Using Machines: Before you do tasks that may require special attention, wait until you know how you respond to BRUKINSA. If you have blurred vision, feel tired or dizzy, do not drive or use tools or machines.

Tell your healthcare professional about all the medicines you take, including any drugs, vitamins, minerals, natural supplements or alternative medicines.

The following may interact with BRUKINSA:
- Antibiotics used to treat bacterial infections (clarithromycin, erythromycin, rifampin).
- Medicines for fungal infections (fluconazole, ketoconazole, itraconazole, posaconazole, voriconazole).
- Medicines for HIV infection (indinavir, ritonavir).
- Medicines to treat low blood sodium levels (conivaptan).
- Medicines to treat hepatitis C (telaprevir).
- Medicines used to prevent seizures or to treat epilepsy or medicines used to treat a painful condition of the face called trigeminal neuralgia (carbamazepine, phenytoin).
- Medicines used to treat heart conditions or high blood pressure (diltiazem, verapamil).
- St. John’s Wort.
- Grapefruit, grapefruit juice and Seville oranges.

How to take BRUKINSA:
- Take it exactly as your healthcare provider tells you. Do not decrease, stop or change your dose on your own.
- Take at about the same time each day.
- Take with or without food.
- Swallow whole with a glass of water. Do NOT chew, dissolve or open the capsule.

Usual Adult Dose:
Take 320 mg daily. Take two 80 mg capsules twice a day (twelve hours apart) OR four 80 mg capsules once a day.

Do not take BRUKINSA with the following:
- grapefruit, grapefruit juice and Seville oranges
- St. John’s wort

Your doctor may change your usual dose depending on whether you experience side effects while taking BRUKINSA.

Overdose:
If you think you have taken too much BRUKINSA, contact your healthcare professional, hospital emergency department or regional poison control centre immediately, even if there are no symptoms.

Missed Dose:
If you miss a dose, take it as soon as possible on the same day. Take your next dose of BRUKINSA at the normal schedule the following day. Do not take an extra dose to make up for a missed dose.
What are possible side effects from using BRUKINSA?
These are not all the possible side effects you may feel when taking BRUKINSA. If you experience any side effects not listed here, contact your healthcare professional.

Side effects may include:
- abdominal pain, joint pain, muscle pain/aches, pain in the arms and legs, back pain
- acid reflux disease
- blurred vision
- chest pain
- constipation
- decrease in weight and appetite
- depression
- dizziness
- dry mouth
- excessive sweating
- fainting
- fever
- headache
- mouth sores
- muscle spasms
- nausea or vomiting
- numbness, tingling, muscle weakness and pain
- rash or redness of the skin
- ringing, buzzing, clicking or hissing in the ears
- swelling of the joints, legs or hands
- tiny red or purple spots on the skin, bruising, itching
- tiredness
- waking up at night to urinate

BRUKINSA can cause abnormal blood test results. Your doctor may do blood tests before you start BRUKINSA and while you take it. Your doctor will decide when to perform blood tests and will interpret the results.

**Reporting Side Effects**

You can report any suspected side effects associated with the use of health products to Health Canada by:

- Visiting the Web page on Adverse Reaction Reporting  
  ([https://www.canada.ca/en/health-canada/services/drugs-health-products/medeffect-canada/adverse-reaction-reporting.html](https://www.canada.ca/en/health-canada/services/drugs-health-products/medeffect-canada/adverse-reaction-reporting.html)) for information on how to report online, by mail or by fax; or
- Calling toll-free at 1-866-234-2345.

*NOTE: Contact your health professional if you need information about how to manage your side effects. The Canada Vigilance Program does not provide medical advice.*

**Storage:**

Store at room temperature between 15 to 30°C in original bottle.

Keep out of reach and sight of children.

**If you want more information about BRUKINSA:**

- Talk to your healthcare professional.
- Find the full product monograph that is prepared for healthcare professionals and includes this Patient Medication Information by visiting the Health Canada website ([https://health-products.canada.ca/dpd-bdpp/index-eng.jsp](https://health-products.canada.ca/dpd-bdpp/index-eng.jsp)); the manufacturer’s website beigene.com or by calling 1-877-828-5598.

This leaflet was prepared by BeiGene Switzerland GmbH.
