INCLUDING PATIENT MEDICATION INFORMATION

\textsuperscript{\textregistered}TABRECTA®
Capmatinib Tablets
Tablets, 150 mg and 200 mg capmatinib (as capmatinib hydrochloride) Oral
Protein Kinase Inhibitor

“TABRECTA\textsuperscript{\textregistered}, indicated for:
- the treatment of adult patients with locally advanced unresectable or metastatic non-small cell lung cancer (NSCLC) harbouring mesenchymal-epithelial transition (MET) exon 14 skipping alterations,

has been issued market authorization with conditions, pending the results of trials to verify its clinical benefit. Patients should be advised of the nature of the authorization. For further information for TABRECTA\textsuperscript{\textregistered} please refer to Health Canada’s Notice of Compliance with conditions - drug products web site: https://www.canada.ca/en/health-canada/services/drugs-health-products/drug-products/notice-compliance/conditions.html”

Novartis Pharmaceuticals Canada Inc.
385 Bouchard Blvd.,
Dorval, Quebec

Date of Initial Authorization: May 19, 2022

Submission Control Number: 255972

\textit{TABRECTA is a registered trademark}
What is a Notice of Compliance with Conditions (NOC/c)?

An NOC/c is a form of market approval granted to a product on the basis of promising evidence of clinical effectiveness following review of the submission by Health Canada.

Products authorized under Health Canada’s NOC/c policy are intended for the treatment, prevention or diagnosis of a serious, life-threatening or severely debilitating illness. They have demonstrated promising benefit, are of high quality and possess an acceptable safety profile based on a benefit/risk assessment. In addition, they either respond to a serious unmet medical need in Canada or have demonstrated a significant improvement in the benefit/risk profile over existing therapies. Health Canada has provided access to this product on the condition that sponsors carry out additional clinical trials to verify the anticipated benefit within an agreed upon time frame.

PART I: HEALTH PROFESSIONAL INFORMATION

1 INDICATIONS

TABRECTA® (capmatinib tablets) is indicated for:

- the treatment of adult patients with locally advanced unresectable or metastatic non-small cell lung cancer (NSCLC) harbouring mesenchymal-epithelial transition (MET) exon 14 skipping alterations.

Efficacy in patients with NSCLC harbouring MET exon 14 skipping (METex14) alterations was based on overall response rate and duration of response in a single-arm study (see 14 CLINICAL TRIALS).

Documentation of the presence of a METex14 alteration based on a validated test is required prior to treatment with TABRECTA (see 7 WARNINGS AND PRECAUTIONS).

1.1 Pediatrics

Pediatrics (<18 years of age): No data are available to Health Canada; therefore, Health Canada has not authorized an indication for pediatric use.

1.2 Geriatrics

Geriatrics (≥65 years of age): In Study A2201 (GEOMETRY mono-1), 61% of the 373 patients were 65 years of age or older, and 18% were 75 years of age or older. No clinically important differences in safety or efficacy were observed between patients aged 65 years or older and younger patients.

2 CONTRAINDICATIONS

TABRECTA is contraindicated in patients who are hypersensitive to this drug or to any ingredient in the formulation, including any non-medicinal ingredient, or component of the container. For a complete listing, see 6 DOSAGE FORMS, STRENGTHS, COMPOSITION AND PACKAGING.

3 SERIOUS WARNINGS AND PRECAUTIONS BOX

- Interstitial lung disease (ILD) / Pneumonitis (see 7 WARNINGS AND PRECAUTIONS).
- Hepatotoxicity (see 7 WARNINGS AND PRECAUTIONS).
- Embryo-fetal toxicity (see 7 WARNINGS AND PRECAUTIONS).
4 DOSAGE AND ADMINISTRATION

4.1 Dosing Considerations

- TABRECTA has not been studied in patients with severe renal impairment. No dose adjustment is necessary in patients with mild or moderate renal impairment (See 10 CLINICAL PHARMACOLOGY).
- No dose adjustment is necessary in patients with mild, moderate, or severe hepatic impairment (See 10 CLINICAL PHARMACOLOGY).

4.2 Recommended Dose and Dosage Adjustment

- Recommended Dose
  The recommended dose of TABRECTA is 400 mg orally twice daily with or without food (See 10 CLINICAL PHARMACOLOGY).

- Treatment duration
  Treatment should be continued until disease progression or unacceptable toxicity.

- Dose modifications for adverse reactions
  The recommended dose reduction schedule for the management of adverse reactions (ARs) based on individual safety and tolerability is listed in Table 1.

Table 1 TABRECTA dose reduction schedule

<table>
<thead>
<tr>
<th>Dose level</th>
<th>Dose and schedule</th>
<th>Number and strength of tablets</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starting dose</td>
<td>400 mg twice daily</td>
<td>Two 200 mg tablets / twice daily</td>
</tr>
<tr>
<td>First-dose reduction</td>

<td>Two 150 mg tablets / twice daily</td>
</tr>
<tr>
<td>Second-dose reduction</td>
<td>200 mg twice daily</td>
<td>One 200 mg tablet / twice daily</td>
</tr>
</tbody>
</table>

TABRECTA should be permanently discontinued in patients unable to tolerate 200 mg orally twice daily.

Recommendations for dose modifications of TABRECTA for adverse reactions (ARs) are provided in Table 2.

**Pediatrics (<18 years of age):** Health Canada has not authorized an indication for pediatric use.

**Geriatrics (≥65 years of age):** No dose adjustment is necessary in patients 65 years of age or older.

**Renal Impairment:** No dose adjustment is recommended in patients with mild or moderate renal impairment. The pharmacokinetics and safety of TABRECTA in patients with severe renal impairment have not been studied (see **10 CLINICAL PHARMACOLOGY**).

**Hepatic Impairment:** No dose adjustment is necessary in patients with mild, moderate, or severe hepatic impairment (See **10 CLINICAL PHARMACOLOGY**).

### 4.4 Administration

TABRECTA should be taken orally twice daily with or without food. The tablets should be swallowed whole and should not be broken, chewed, or crushed (See **10 CLINICAL PHARMACOLOGY**).

### 4.5 Missed dose

If a dose of TABRECTA is missed or vomiting occurs, the patient should not make up the dose, but take the next dose at the scheduled time.

### 5 OVERDOSAGE

There is limited experience with overdose in clinical studies with TABRECTA. Patients should be closely monitored for signs or symptoms of adverse reactions, and general supportive measures and symptomatic treatment should be initiated in cases of suspected overdose. In case of overdose, TABRECTA should be withheld and symptomatic treatment initiated.

For management of a suspected drug overdose, contact your regional poison control centre.

### 6 DOSAGE FORMS, STRENGTHS, COMPOSITION AND PACKAGING

TABRECTA (capmatinib) 150 mg film-coated tablet: pale orange brown, ovaloid, curved film-coated tablet with beveled edges, unscored, debossed with ‘DU’ on one side and ‘NVR’ on the other side. TABRECTA (capmatinib) 200 mg film-coated tablet: yellow, ovaloid, curved film-coated tablet with beveled edges, unscored, debossed with ‘LO’ on one side and ‘NVR’ on the other side.

Packaging

TABRECTA 150 mg and 200 mg tablets are supplied in blister packaging: 12 blisters/card, 5 or 10 cards/carton (60 or 120 tablets).

7 WARNINGS AND PRECAUTIONS

Please see 3 SERIOUS WARNINGS AND PRECAUTIONS BOX.

General

Patient selection for METex14 alterations
Documentation of the presence of a METex14 alteration using a validated test is required prior to treatment with TABRECTA (see 14 CLINICAL TRIALS).

Driving and Operating Machinery

No studies on the effects of TABRECTA on the ability to drive or use machines have been performed. Exercise caution when driving or operating a vehicle or potentially dangerous machinery until the patient is reasonably certain that TABRECTA does not affect them adversely.

Hepatic/Biliary/Pancreatic

Hepatotoxicity

Hepatotoxicity occurred in patients treated with TABRECTA (see 8 ADVERSE REACTIONS). Any Grade transaminase (alanine aminotransferase [ALT] and/or aspartate aminotransferase [AST]) elevations were reported in 52 of 373 patients (13.9%) treated with TABRECTA in Study A2201 (GEOMETRY mono-1). Grade 3 or 4 ALT/AST elevations were observed in 24 of 373 patients (6.4%) treated with TABRECTA. Three patients (0.8%) discontinued TABRECTA due to ALT/AST elevations. One patient died due to hepatitis. ALT/AST elevations mostly occurred within approximately the first 3 months of treatment. The median time-to-onset of Grade 3 or higher ALT/AST elevations was 7.6 weeks (range: 2.1 to 39.1 weeks).

Liver function tests (including ALT, AST, and total bilirubin) should be performed prior to the start of treatment, every 2 weeks during the first 3 months of treatment, then once a month or as clinically indicated, with more frequent testing in patients who develop transaminase or bilirubin elevations. Based on the severity of the transaminase elevations, temporarily withhold, dose reduce, or permanently discontinue TABRECTA (see 4.2 Recommended Dose and Dosage Adjustment).
Elevations of pancreatic enzymes

Elevations in amylase and lipase were reported in 33 of 373 patients (8.8%) treated with TABRECTA in Study GEOMETRY mono-1. Grade 3 or 4 amylase and lipase elevations were reported in 3.8% and 6.2% of patients, respectively. Two patients (0.5%) discontinued TABRECTA due to lipase elevations. The median time to onset of grade 3 or higher amylase/lipase elevations was 7.8 weeks (range: 0.1 to 135.0 weeks). Acute pancreatitis was reported in one patient (0.3%).

Amylase and lipase should be monitored at baseline and regularly during treatment with TABRECTA. Based on the severity of the pancreatic enzymes’ elevations, temporarily withhold, dose reduce, or permanently discontinue TABRECTA (see 4.2 Recommended Dose and Dosage Adjustment).

Immune

Hypersensitivity

No cases of serious hypersensitivity were reported in patients treated with TABRECTA in Study GEOMETRY mono - 1. In other clinical trials, cases of serious hypersensitivity were reported uncommonly (< 1%) in patients treated with TABRECTA (see 8.2 Clinical Trial Adverse Reactions). Clinical symptoms included pyrexia, chills, pruritus, rash, blood pressure decreased, nausea and vomiting.

Reproductive Health: Female and Male Potential

• Fertility

There are no data on the effect of capmatinib on human fertility. Fertility studies with capmatinib were not conducted in animals.

• Teratogenic Risk

Based on findings from animal studies and its mechanism of action, TABRECTA can cause fetal harm when administered to a pregnant woman. Oral administration of capmatinib to pregnant rats and rabbits during the period of organogenesis resulted in malformations at exposures less than the human exposure (see 16 NON-CLINICAL TOXICOLOGY). Pregnant women and females of reproductive potential should be advised of the potential risk to a fetus if TABRECTA is used during pregnancy or if the patient becomes pregnant while taking TABRECTA. Sexually-active females of reproductive potential should use effective contraception during treatment with TABRECTA and for at least 7 days after the last dose. Male patients with sexual partners who are pregnant, possibly pregnant, or who could become pregnant should use condoms during treatment with TABRECTA and for at least 7 days after the last dose (see 7.1 Special Populations).

Respiratory

Interstitial Lung Disease (ILD)/Pneumonitis

ILD/pneumonitis, which can be fatal, has occurred in patients treated with TABRECTA (see 8 ADVERSE
**REACTIONS.** Any Grade ILD/pneumonitis was reported in 16 of 373 patients (4.3%) treated with TABRECTA in Study A2201 (GEOMETRY mono-1). Grade 3 ILD/pneumonitis was reported in 6 patients (1.6%), with a fatal event of pneumonitis reported in 1 patient (0.3%). ILD/pneumonitis occurred in 9 of 173 patients (5.2%) with a history of prior radiotherapy and 7 of 200 patients (3.5%) who did not receive prior radiotherapy. Eight patients (2.1%) discontinued TABRECTA due to ILD/pneumonitis. ILD/pneumonitis mostly occurred within approximately the first 3 months of treatment. The median time-to-onset of Grade 3 or higher ILD/pneumonitis was 6.0 weeks (range: 0.7 to 64.4 weeks).

Prompt investigation should be performed in any patient with new or worsening of pulmonary symptoms indicative of ILD/pneumonitis (e.g. dyspnea, cough, fever). TABRECTA should be immediately withheld in patients with suspected ILD/pneumonitis and permanently discontinued if no other potential causes of ILD/pneumonitis are identified (see 4 DOSAGE AND ADMINISTRATION).

**Skin**

**Risk of Photosensitivity**

Based on findings from animal studies, there is a potential risk of photosensitivity reactions with TABRECTA (see 16 NON-CLINICAL TOXICOLOGY). In GEOMETRY mono-1, it was recommended that patients use precautionary measures against ultraviolet exposure such as the use of sunscreen or protective clothing during treatment with TABRECTA. Patients should be advised to limit direct ultraviolet exposure during treatment with TABRECTA.

### 7.1 Special Populations

#### 7.1.1 Pregnant Women

Based on findings from animal studies and its mechanism of action, TABRECTA can cause fetal harm when administered to a pregnant woman. There are no adequate and well-controlled studies in pregnant women to inform a product-associated risk. Oral administration of capmatinib to pregnant rats and rabbits during the period of organogenesis resulted in fetotoxicity and teratogenicity. Reduced fetal weights and increased incidences of fetal malformations were observed in rats and rabbits following prenatal exposure to capmatinib at or below the exposure in humans at the maximum recommended human dose (MRHD) of 400 mg twice daily based on area under the curve (AUC). TABRECTA should not be used during pregnancy, unless clearly necessary, and only after a careful consideration of both the mother’s need and the risk to the fetus.

Sexually-active females of reproductive potential should use effective contraception (methods that result in less than 1% pregnancy rates) during treatment with TABRECTA and for at least 7 days after the last dose.

Pregnant women and females of reproductive potential should be advised of the potential risk to a fetus if TABRECTA is used during pregnancy or if the patient becomes pregnant while taking TABRECTA. Male patients with sexual partners who are pregnant, possibly pregnant, or who could become pregnant should use condoms during treatment with TABRECTA and for at least 7 days after the last dose.
7.1.2 Breast-feeding

It is not known if capmatinib is transferred into human milk after administration of TABRECTA. There are no data on the effects of capmatinib on the breastfed child or on milk production. Because of the potential for serious adverse drug reactions in breast-fed children, breast-feeding is not recommended during treatment with TABRECTA and for at least 7 days after the last dose.

7.1.3 Pediatrics

Pediatrics (<18 years of age): No data are available to Health Canada; therefore, Health Canada has not authorized an indication for pediatric use.

7.1.4 Geriatrics

Geriatrics (≥65 years of age): In Study A2201 (GEOMETRY mono-1), 61% of the 373 patients were 65 years of age or older, and 18% were 75 years of age or older. No clinically important differences in safety or efficacy were observed between patients aged 65 years or older and younger patients.

8 ADVERSE REACTIONS

8.1 Adverse reaction overview

The safety of TABRECTA was evaluated in 373 adult patients with locally advanced or metastatic NSCLC in the pivotal multi-cohort Study A2201 (GEOMETRY mono-1) (see 14 CLINICAL TRIALS). The median duration of exposure to TABRECTA across all cohorts was 17.9 weeks (range: 0.4 to 251.6 weeks). Among patients who received TABRECTA, 36.7% were exposed for at least 6 months and 18.8% were exposed for at least one year.

Serious adverse events (AEs) were reported in 190 patients (50.9%) who received TABRECTA. Serious AEs in > 2% of patients included dyspnea (6.7%), pneumonia (5.9%), pleural effusion (4.3%), general physical health deterioration (2.9%), and vomiting (2.4%). Fourteen patients (3.8%) died while on treatment with TABRECTA due to causes other than the underlying malignancy, including one hepatitis and one treatment-related pneumonitis.

Permanent discontinuation of TABRECTA due to an AE was reported in 60 patients (16.2%). The most frequent AEs (≥0.5%) leading to permanent discontinuation of TABRECTA were peripheral edema (2.1%), pneumonitis (1.6%), fatigue (1.3%), ALT increased (0.8%), AST increased (0.8%), nausea (0.8%), pneumonia (0.8%), vomiting (0.8%), blood bilirubin increased (0.5%), blood creatinine increased (0.5%), general physical health deterioration (0.5%), interstitial lung disease (ILD) (0.5%), lipase increased (0.5%) and organising pneumonia (0.5%).

Dose interruptions due to an adverse event were reported in 208 patients (55.8%) who received TABRECTA. Adverse events requiring dose interruption in > 2% of patients who received TABRECTA included peripheral edema (10.7%), blood creatinine increased (8.0%), nausea (5.9%), lipase increased (5.1%), vomiting (5.1%), ALT increased (4.6%), pneumonia (4.3%), dyspnoea (4.0%), amylase increased (3.2%), AST increased (2.9%), and asthenia (2.1%).

Dose reductions due to an adverse event were reported in 97 patients (26.0%) who received TABRECTA. Adverse events requiring dose reductions in > 2% of patients who received TABRECTA included peripheral edema (9.4%) and ALT increased (3.2%).
The most common adverse reactions (ARs) reported with an incidence of ≥20% (all Grades) in patients who received TABRECTA were peripheral edema, nausea, fatigue, vomiting, dyspnea, and decreased appetite. The most common Grade 3 or 4 ARs reported with an incidence of ≥5% in patients who received TABRECTA were peripheral edema, fatigue, dyspnea.

8.2 Clinical Trial Adverse Reactions

Clinical trials are conducted under very specific conditions. The adverse reaction rates observed in the clinical trials; therefore, may not reflect the rates observed in practice and should not be compared to the rates in the clinical trials of another drug. Adverse reaction information from clinical trials may be useful in identifying and approximating rates of adverse drug reactions in real-world use.

Adverse reactions from study A2201 (GEOMETRY mono-1) are listed in Table 4 by MedDRA system organ class (SOC). Within each SOC, the adverse reactions are ranked by frequency, with the most frequent reactions first.

Table 4  Adverse reactions (≥ 1%) in patients who received TABRECTA in the pivotal Study A2201 (GEOMETRY mono-1)

9 DRUG INTERACTIONS

9.2 Drug Interactions Overview

Capmatinib is a substrate of CYP3A4. Coadministration of TABRECTA with a strong CYP3A inhibitor may increase the incidence and severity of adverse drug reactions of TABRECTA. Coadministration of TABRECTA with a strong or moderate CYP3A inducer may decrease TABRECTA anti-tumor activity. Meanwhile, capmatinib is a moderate inhibitor of CYP1A2 and also an inhibitor of transporters P-gp and BCRP. Coadministration of TABRECTA with a CYP1A2, P-gp or BCRP substrate may increase the incidence and severity of adverse drug reactions of these substrates.

9.4 Drug-Drug Interactions

The drugs listed in this table are based on either drug interaction case reports or studies, or potential interactions due to the expected magnitude and seriousness of the interaction (i.e., those identified as contraindicated).

Table 6 - Established or Potential Drug-Drug Interactions

<tr>
<td>Strong CYP3A inhibitors (including but not limited to, clarithromycin, indinavir, itraconazole, ketoconazole, lopinavir/ritonavir, nefazodone, nelfinavir, posaconazole, ritonavir, saquinavir, telaprevir, telithromycin, verapamil, and voriconazole)</td>
<td>CT</td>
<td>In healthy subjects, coadministration of a single 200 mg capmatinib dose with the strong CYP3A inhibitor itraconazole (200 mg once daily for 10 days) increased capmatinib AUCinf by 42% with no change in capmatinib Cmax compared to administration of capmatinib alone. Coadministration of TABRECTA with a strong CYP3A inhibitor may increase the incidence and severity of adverse drug reactions of TABRECTA.</td>
<td>Patients should be closely monitored for adverse drug reactions during coadministration of TABRECTA with strong CYP3A inhibitors.</td>
</tr>
</tbody>
</table>
### Strong CYP3A inducers (including but not limited to, carbamazepine, phenobarbital, phenytoin, rifampicin and St. John’s wort (*Hypericum perforatum*)

| CT | In healthy subjects, coadministration of a single 400 mg capmatinib dose with the strong CYP3A inducer rifampicin (600 mg once daily for 9 days) decreased capmatinib AUC$_{\text{inf}}$ by 67% and decreased Cmax by 56% compared to administration of capmatinib alone. Decreases in capmatinib exposure may decrease TABRECTA anti-tumor activity. |
|——|——|
| Coadministration of TABRECTA with strong CYP3A inducers, should be avoided. An alternative medication with no or minimal potential to induce CYP3A should be considered. |

### Moderate CYP3A inducers (including but not limited to efavirenz)

| PBPK | Simulations using physiologically-based pharmacokinetic (PBPK) models predicted that coadministration of a 400 mg capmatinib dose with the moderate CYP3A inducer efavirenz (600 mg once daily for 20 days) would result in a 44% decrease in capmatinib AUC$_{\text{0-12h}}$ and 34% decrease in Cmax at steady-state compared to administration of capmatinib alone. Decreases in capmatinib exposure may decrease TABRECTA anti-tumor activity. |
|——|——|
| Coadministration of TABRECTA with moderate CYP3A inducers, should be avoided. An alternative medication with no or minimal potential to induce CYP3A should be considered. |

---

**Effect of TABRECTA on other medicinal products**

### Substrates of CYP enzymes (including but not limited to theophylline and tizanidine)

| CT | In cancer patients, coadministration of caffeine (CYP1A2 probe substrate) with multiple doses of capmatinib (400 mg twice daily) increased caffeine AUC$_{\text{inf}}$ by 134% with no change in caffeine Cmax compared to administration of caffeine alone. Coadministration of TABRECTA with a CYP1A2 substrate may increase the incidence and severity of adverse drug reactions of these substrates. |
|——|——|
| If coadministration is unavoidable between TABRECTA and CYP1A2 substrates where minimal concentration changes may lead to serious adverse drug reactions, decrease the CYP1A2 substrate dose in accordance with the approved product monograph. |
### P-glycoprotein (P-gp) and breast cancer resistance protein (BCRP) substrates

*P-glycoprotein (P-gp) (including but not limited to digoxin, dabigatran etexilate, colchicine, sitagliptin, saxagliptin and posaconazole)*

In cancer patients, coadministration of digoxin (P-gp substrate) with multiple doses of capmatinib (400 mg twice daily) increased digoxin AUC<sub>inf</sub> by 47% and increased C<sub>max</sub> by 74% compared to administration of digoxin alone. In cancer patients, coadministration of rosuvastatin (BCRP substrate) with multiple doses of capmatinib (400 mg twice daily) increased rosuvastatin AUC<sub>inf</sub> by 108% and increased C<sub>max</sub> by 204% compared to administration of rosuvastatin alone.

Coadministration of TABRECTA with a P-gp or BCRP substrate may increase the incidence and severity of adverse drug reactions of these substrates. If coadministration is unavoidable between TABRECTA and P-gp or BCRP substrates where minimal concentration changes may lead to serious adverse drug reactions, decrease the P-gp or BCRP substrate dose in accordance with the approved product monograph.

<table>

<td>MATE1 and MATE2K substrates</td>
<td>In vitro</td>
<td>Based on in vitro data, capmatinib and its major metabolite CMN288 showed reversible inhibition of renal transports MATE1 and MATE2K. Capmatinib may inhibit MATE1 and MATE2K at clinically relevant concentrations. Coadministration of TABRECTA may increase the exposure of MATE1 and MATE2K substrates, which may increase the adverse reactions of these substrates. If coadministration is unavoidable between TABRECTA and MATE1 or MATE2K substrates where minimal concentration changes may lead to serious adverse reactions, decrease the MATE1 or MATE2K substrate dosage in accordance with the approved product monograph.</td>
</tr>
</tbody>
</table>

Legend: C = Case Study; CT = Clinical Trial; T = Theoretical; PBPK = physiologically-based pharmacokinetic

### Substrates of CYP3A enzyme

In cancer patients, coadministration of midazolam (CYP3A substrate) with multiple doses of capmatinib (400 mg twice daily) did not cause any clinically significant increase in midazolam exposure (9% increase in AUC<sub>inf</sub> and 22% increase in C<sub>max</sub>) compared to administration of midazolam alone.

Clinically relevant drug-drug interactions between capmatinib and CYP3A substrates are unlikely to occur as coadministration of capmatinib had no clinically meaningful effect on exposure of midazolam (a CYP3A substrate).
Agents that raise gastric pH

Capmatinib demonstrates pH-dependent solubility and becomes poorly soluble as pH increases *in vitro*. In healthy subjects, coadministration of a single 600 mg capmatinib dose with the proton pump inhibitor rabeprazole (20 mg once daily for 4 days) decreased capmatinib AUCinf by 25% and decreased Cmax by 38% compared to administration of capmatinib alone. Clinically relevant drug drug interactions between capmatinib and gastric-acid-reducing-agents are unlikely to occur as co-administration of rabeprazole had no clinically meaningful effect on exposure of capmatinib.

In vitro evaluation of drug interaction potential

Interactions between enzymes and TABRECTA

In vitro studies showed that capmatinib is an inhibitor of CYP2C8, CYP2C9, and CYP2C19. Capmatinib also showed induction of CYP2B6 and CYP2C9 in cultured human hepatocytes. Simulations using PBPK models predicted that capmatinib given at a dose of 400 mg twice daily is unlikely to cause clinically relevant interaction via CYP2B6, CYP2C8, CYP2C9 or CYP2C19.

Interactions between transporters and TABRECTA

Based on in vitro data, capmatinib showed inhibition of uptake transporters OATP1B1, OATP1B3, OAT1, OAT3 and OCT1. However, capmatinib is not expected to cause clinically relevant inhibition of OATP1B1, OATP1B3, OAT1, OAT3 and OCT1 uptake transporters based on the concentration achieved at the therapeutic dose. Capmatinib is not a multidrug resistance-associated protein (MRP2) inhibitor in vitro at clinically relevant concentrations.

Based on in vitro data, capmatinib is an inhibitor of bile salt export pump (BSEP).

Based on in vitro data, capmatinib is a P-gp substrate, but not a BCRP or MRP2 substrate. Capmatinib is not a substrate of transporters involved in active hepatic uptake in primary human hepatocytes.

9.5 Drug-Food Interactions

Food does not alter capmatinib bioavailability to a clinically meaningful extent. TABRECTA can be administered with or without food (see 4 DOSAGE AND ADMINISTRATION and 10 CLINICAL PHARMACOLOGY).

Concomitant use of TABRECTA with grapefruit products may increase the incidence and severity of adverse drug reactions of TABRECTA. Patients should be closely monitored for adverse drug reactions.

9.6 Drug-Herb Interactions

Interactions with herbal products have not been established. Avoid concomitant use of St. John’s Wort, as this herb is a strong inducer of CYP3A.

9.7 Drug-Laboratory Test Interactions

Interactions with laboratory tests have not been established.
10 CLINICAL PHARMACOLOGY

10.1 Mechanism of Action

Capmatinib is an inhibitor of the MET receptor tyrosine kinase. Capmatinib treatment resulted in regression of tumor xenograft models derived from lung cancer including all alterations leading to MET exon 14 skipping mutations. Capmatinib inhibits MET phosphorylation (both autophosphorylation and phosphorylation triggered by the ligand hepatocyte growth factor [HGF]), MET-mediated phosphorylation of downstream signaling proteins, as well as proliferation and survival of MET-dependent cancer cells.

10.2 Pharmacodynamics

Capmatinib exposure-response relationships and the time course of pharmacodynamics response are unknown.

Cardiac electrophysiology

Based on a pharmacokinetic-pharmacodynamic analysis of pooled data from two open-label, uncontrolled studies with a combined total of 273 patients with advanced solid tumours, of whom 265 received capmatinib at a dose of 400 mg twice a day, large mean increases from baseline (i.e., >20 msec) in the QTc interval were not predicted at concentrations expected with the recommended therapeutic dose of 400 mg twice daily.

10.3 Pharmacokinetics

Capmatinib exhibited dose-proportional increases in systemic exposure (AUCinf and Cmax) across the dose range tested (200 to 400 mg twice daily). Steady-state is expected to be achieved after approximately 3 days after oral dosing of capmatinib 400 mg twice daily, with a geometric mean accumulation ratio of 1.39 (coefficient of variation [CV]: 42.9%).

</tbody>
</table>

¹ Geomean (Geomean CV%): geometric mean (CV% of geometric mean)
² tmax are presented as median values
³ t1/2,eff: effective half-life calculated from the geometric mean accumulation ratio of 1.39.
⁴ Vss/F is estimated using popPK approach (Vss/F=V1/F+V2/F).
Absorption:

Peak plasma levels of capmatinib (Cmax) were reached approximately 1 to 2 hours (Tmax) after an oral 400 mg dose of capmatinib in cancer patients. The absorption of capmatinib after oral administration is estimated to be greater than 70%.

Food Effect

Food does not alter capmatinib bioavailability to a clinically meaningful extent. TABRECTA can be administered with or without food (see 4 DOSAGE AND ADMINISTRATION).

Oral administration of a single 600 mg dose with high-fat and low-fat meals in healthy subjects increased capmatinib AUCinf by 46% and 20%, respectively, while no change in Cmax was observed when compared to capmatinib administration under fasting conditions.

Distribution:

Capmatinib is 96% bound to human plasma proteins, independent of concentration. The apparent mean volume of distribution at steady-state (Vss/F) is 164 L in cancer patients. The blood-to-plasma ratio was 1.5 (concentration range of 10 to 1000 ng/mL), but decreased at higher concentrations to 0.9 (concentration 10000 ng/mL).

Capmatinib crossed the blood-brain barrier in rats with a brain-to-blood exposure (AUCinf) ratio of approximately 9%.

Metabolism:

In vitro and in vivo studies indicated that capmatinib is cleared mainly through metabolism driven by cytochrome P450 (CYP) 3A4 and aldehyde oxidase. The most abundant radioactive component in plasma is unchanged capmatinib (42.9% of radioactivity AUC0-12h). The major circulating metabolite, M16 (CMN288), is pharmacologically inactive and accounts for 21.5% of the radioactivity in plasma AUC0-12h.

Elimination:

The effective elimination half-life of capmatinib is 6.54 hours. The geometric mean steady-state apparent oral clearance (CLss/F) of capmatinib was 19.8 L/hr.

Capmatinib is eliminated mainly through metabolism, and subsequent fecal excretion. Following a single oral administration of [14C]-capmatinib to healthy subjects, 78 ±10% of the total radioactivity was recovered in the feces and 22 ±8.5% in the urine. Unchanged capmatinib in feces accounted for 42 ±23% of the dose while in urine is negligible.

Special Populations and Conditions

Effects of age, gender, race, and bodyweight: Population pharmacokinetic analysis showed that there is no clinically relevant effect of age (26 to 90 years), gender, race (Caucasian, Asian, Native American, Black, unknown), and body weight (35 to 131 kg) on the systemic exposure of capmatinib.
• **Hepatic Insufficiency:** A study was conducted in non-cancer subjects with various degrees of hepatic impairment based on Child-Pugh classification using a 200 mg single-dose of capmatinib. The geometric mean systemic exposure (AUCinf) of capmatinib was decreased by approximately 23% and 9% in subjects with mild (N = 6) and moderate (N = 8) hepatic impairment, respectively, and increased by approximately 24% in subjects with severe (N = 6) hepatic impairment compared to subjects with normal (N = 9) hepatic function. Cmax was decreased by approximately 28% and 17% in subjects with mild and moderate hepatic impairment, respectively, compared to subjects with normal hepatic function, while Cmax was similar (increased by 2%) in subjects with severe hepatic impairment compared to subjects with normal hepatic function (see [4 DOSAGE AND ADMINISTRATION](#)). Mild, moderate or severe hepatic impairment had no clinically significant effect on the exposure of capmatinib.

• **Renal Insufficiency:** Based on a population pharmacokinetic analysis that included 207 patients with normal renal function (creatinine clearance [CLcr] ≥90 mL/min), 200 patients with mild renal impairment (CLcr 60 to 89 mL/min), and 94 patients with moderate renal impairment (CLcr 30 to 59 mL/min), mild or moderate renal impairments had no clinically significant effect on the exposure of capmatinib. TABRECTA has not been studied in patients with severe renal impairment (CLcr 15 to 29 mL/min) (see [4 DOSAGE AND ADMINISTRATION](#)).

11 **STORAGE, STABILITY AND DISPOSAL**

TABRECTA (capmatinib) should not be stored above 25°C. Store in the original package to protect from moisture.
TABRECTA film-coated tablets must be kept out of reach and sight of children.

12 **SPECIAL HANDLING INSTRUCTIONS**

No special requirements

Data Cut-off date: 18-Sep-2020
EGFR = epidermal growth factor receptor; ALK = anaplastic lymphoma kinase

The efficacy and safety of TABRECTA were evaluated in A2201 (GEOMETRY mono-1), a multicenter, non-randomized, open-label, multi-cohort Phase II study in adult patients with locally advanced (Stage IIIB) or metastatic (Stage IV) NSCLC with MET dysregulation. Patients (N = 373) were enrolled into study
cohorts based on their prior treatment status (treatment-naïve or previously treated) and MET dysregulation status (MET exon 14 skipping [METex14] alteration and/or MET amplification). Patients with METex14-altered NSCLC (N = 160) were enrolled into the MET-altered cohorts regardless of MET amplification. Patients with MET amplification and without METex14 alterations in the tumour were enrolled into the MET-amplified cohorts.

The presence of METex14 in tumour specimens was determined using a validated clinical trial assay (CTA) which is a qualitative real-time reverse transcriptase-polymerase chain reaction (RT-PCR) designed to detect MET exon 14 skipping mRNA derived from formalin-fixed, paraffin-embedded tumour tissues.

Eligible patients were required to have EGFR wild-type and ALK rearrangement negative status, at least one measurable lesion as defined by Response Evaluation Criteria in Solid Tumors (RECIST) version 1.1, adequate organ functions, and Eastern Cooperative Oncology Group (ECOG) performance status (PS) 0 to 1. Patients with symptomatic central nervous system (CNS) metastases who were neurologically unstable or required increasing doses of steroids within the prior 2 weeks to manage CNS symptoms, patients with clinically significant uncontrolled cardiac disease, or patients pre-treated with any MET or hepatic growth factor (HGF) inhibitor were not eligible for the study.

The primary endpoint of the study was overall response rate (ORR) as determined by a Blinded Independent Review Committee (BIRC) according to RECIST 1.1. The key secondary endpoint was duration of response (DOR) by BIRC. The efficacy data for treatment-naïve and previously treated patients were analyzed independently i.e. separately per cohort.

The efficacy population comprised 160 adult patients with METex14-altered, locally advanced or metastatic NSCLC (60 patients enrolled in the treatment-naïve cohorts [Cohorts 5b and 7] and 100 patients enrolled in the previously treated cohorts [Cohorts 4 and 6]). Previously treated patients had received 1 or 2 prior lines of systemic therapy for metastatic disease.

In the efficacy population, the majority of patients were White (77%), followed by Asian (19%). Sixty-one percent of patients were never smokers, 83% had adenocarcinoma, 8% had squamous cell lung carcinoma, 25% had ECOG PS 0, 74% had ECOG PS 1, 99% had Stage IV disease and 16% had CNS metastases. In the previously treated cohorts, 91% had prior chemotherapy, 86% had prior platinum-based chemotherapy, 32% had prior immunotherapy, and 16% had received 2 prior systemic therapies.

Efficacy results for treatment-naïve and previously treated patients are presented in Table 9 and Table 10, respectively.

$ %$ change in target lesion available but contraindicated by overall lesion response=PD or UNK

$n$ (number of patients with measurable disease at baseline and at least one valid post-baseline assessment) was used for calculation of percentages.

A post-baseline assessment with unknown response for target lesion or unknown overall lesion response was considered invalid.
MICROBIOLOGY

No microbiological information is required for this drug product.

NON-CLINICAL TOXICOLOGY

General Toxicology: Repeat-dose toxicity studies of up to 3 months’ duration were conducted in rats and cynomolgus monkeys. The principal target organs were the pancreas, brain/central nervous system (CNS), liver, and kidney.

In a 3-month study in rats, capmatinib was administered to males at 20, 40, 60, and 90 mg/kg/day, and females at 10, 20, 30, and 45 mg/kg/day. Mortality was observed at ≥60 mg/kg/day in males, and ≥30 mg/kg/day in females. Histopathologic findings included brain white matter vacuolation at doses ≥ 2.2 times the human exposure (AUC) at the recommended dose, and low-grade pancreatic acinar cell vacuolation and/or apoptosis without inflammation, which appeared reversible. Tremors and convulsions were also observed in some of the animals, suggestive of CNS toxicity. Additional findings in a 28-day study included elevations in liver enzymes (ALT, AST, and/or sorbitol dehydrogenase [SDH]) and bilirubin. The No Observed Adverse Effect Level (NOAEL) was 40 mg/kg/day in males and 20 mg/kg/day in females, corresponding to approximately 1.2-fold and 1-fold of the exposure (AUC), respectively, in patients receiving the recommended dose.

In a 3-month study in monkeys, capmatinib was administered at 10, 30, and 75 mg/kg/day. Histopathologic changes included neutrophilic infiltration in the liver, and mononuclear cell infiltration, dilation and inflammation in the kidneys. Additional histopathologic findings in a 28-day study included pancreatic low-grade acinar cell apoptosis and crystalline-like material within the renal interstitium and/or tubular lumen. Follow-up investigations indicated that the kidney material is calcium phosphate precipitates. The NOAEL was 30 mg/kg/day, corresponding to approximately 0.6-to-1.1-fold of the exposure (AUC) in patients receiving the recommended dose.

Carcinogenicity: Carcinogenicity studies with capmatinib have not been conducted.

Genotoxicity: Capmatinib was not mutagenic in the in vitro bacterial reverse mutation assay (Ames test) and did not cause chromosomal aberrations in the in vitro chromosome aberration assay in human peripheral blood lymphocytes. Capmatinib was not clastogenic in the in vivo bone marrow micronucleus test in rats.

Reproductive and Developmental Toxicology: In embryo-fetal development studies in rats and rabbits, pregnant animals received oral doses of capmatinib up to 30 mg/kg/day and 60 mg/kg/day, respectively, during the period of organogenesis. At 30 mg/kg/day in rats and 60 mg/kg/day in rabbits, the maternal systemic exposure (AUC) was approximately 1.4 and 1.5 times, respectively, the exposure in humans at the MRHD of 400 mg twice daily.

In rats, maternal toxicity (reduced body weight gain and food consumption) was observed at the dose of 30 mg/kg/day. Fetal effects included reduced fetal weights, irregular/incomplete ossification, and increased incidences of fetal malformations (e.g. abnormal flexure/inward malrotation of hindpaws/forepaws, thinness of forelimbs, lack of/reduced flexion at the humerus/ulna joints, narrowed or small tongue) at doses of ≥10 mg/kg/day (with maternal systemic exposure at 0.56 times the exposure in humans at the MRHD of 400 mg twice daily).
In rabbits, no maternal effects were detected at doses up to 60 mg/kg/day. Fetal effects included small lung lobe at ≥5 mg/kg/day (with systemic exposure at 0.016 times the exposure in humans at the MRHD of 400 mg twice daily), and reduced fetal weights, irregular/incomplete ossification and increased incidences of fetal malformations (e.g. abnormal flexure/malrotation of hindpaws/forepaws, thinness of forelimbs/hindlimbs, lack of/reduced flexion at the humerus/ulna joints, small lung lobes, narrowed or small tongue) at the dose of 60 mg/kg/day (with systemic exposure at 1.5 times the exposure in humans at the MRHD of 400 mg twice daily).

**Special Toxicology:**

Photosensitivity: In vitro and in vivo photosensitization assays with capmatinib suggested that capmatinib has the potential for photosensitization. The NOAEL for in vivo photosensitization was 30 mg/kg/day (Cmax of 14,000 ng/mL), about 2.9 times the human Cmax at the 400 mg twice daily clinical dose.
PATIENT MEDICATION INFORMATION
READ THIS FOR SAFE AND EFFECTIVE USE OF YOUR MEDICINE

Capmatinib Tablets

Read this carefully before you start taking TABRECTA® and each time you get a refill. This leaflet is a summary and will not tell you everything about this drug. Talk to your healthcare professional about your medical condition and treatment and ask if there is any new information about TABRECTA.

### Serious Warnings and Precautions

- TABRECTA can harm your unborn baby if you take it while you are pregnant.

- TABRECTA can cause serious side effects, including:
  - **Interstitial lung disease / Pneumonitis (inflammation of lungs):** TABRECTA may cause inflammation or scarring of the lungs and can lead to death. Your healthcare professional will monitor you for lung problems. Tell your healthcare professional right away if you develop new or worsening symptoms of lung problems, including: cough, fever, trouble breathing, shortness of breath, or wheezing.

  - **Liver problems:** Increased liver enzymes are very common with TABRECTA. Liver problems may sometimes be serious and can lead to death. Your healthcare professional will perform blood tests to check your liver before and during treatment.

See the “Serious side effects and what to do about them” table, below, for more information on these and other serious side effects.

### What is TABRECTA used for?

For the following indication, TABRECTA has been approved with conditions (NOC/c). This means it has passed Health Canada’s review and can be bought and sold in Canada, but the manufacturer has agreed to complete more studies to make sure the drug works the way it should. For more information, talk to your healthcare professional.

- TABRECTA is used to treat adults with a kind of lung cancer called non-small cell lung cancer (NSCLC). The non-small cell lung cancer:
  - has altered mesenchymal epithelial transition (MET) gene, and
  - has spread to other parts of the body or is advanced and cannot be removed by surgery

Your healthcare professional will test your tumor for certain changes (alterations) in the MET gene. This will make sure that TABRECTA is right for you.

### What is a Notice of Compliance with Conditions (NOC/c)?

A Notice of Compliance with Conditions (NOC/c) is a type of approval to sell a drug in Canada.
Health Canada only gives an NOC/c to a drug that treats, prevents, or helps identify a serious or life-threatening illness. The drug must show promising proof that it works well, is of high quality, and is reasonably safe. Also, the drug must either respond to a serious medical need in Canada, or be much safer than existing treatments.

Drug makers must agree in writing to clearly state on the label that the drug was given an NOC/c, to complete more testing to make sure the drug works the way it should, to actively monitor the drug’s performance after it has been sold, and to report their findings to Health Canada.

How does TABRECTA work?
Altered MET gene can cause your lung cancer to grow. TABRECTA belongs to a class of cancer medicines called MET tyrosine kinase inhibitors. It targets and inhibits this altered MET gene. This helps to slow down or stop the growth and spread of your lung cancer. It may also help to shrink the tumor (cancer).

What are the ingredients in TABRECTA?
Medicinal ingredient: Capmatinib (as capmatinib hydrochloride)
Non-medicinal ingredients: cellulose microcrystalline; crospovidone; hypromellose; iron oxide, black (for the 150 mg tablets); iron oxide, red (for the 150 mg tablets); iron oxide, yellow; macrogol 4000; magnesium stearate; mannitol; povidone; silica colloidal anhydrous; sodium laurilsulfate; talc and titanium dioxide.

TABRECTA comes in the following dosage forms:
Tablets; 150 mg and 200 mg capmatinib (as capmatinib hydrochloride).

Do not use TABRECTA if you:
- are allergic to capmatinib, or any ingredients in this medicine or container.

To help avoid side effects and ensure proper use, talk to your healthcare professional before you take TABRECTA. Talk about any health conditions or problems you may have, including if you:
- have or have had lung or breathing problems other than your lung cancer.
- have or have had liver problems.
- have or have had pancreas problems.

Other warnings you should know about:

Pregnancy and breastfeeding:

Female patients
- If you are pregnant, able to get pregnant or think you are pregnant, there are specific risks you should discuss with your healthcare professional.
- You should not take TABRECTA if you are pregnant. It may harm your unborn baby.
- If you are able to become pregnant:
  - Your healthcare professional will do a pregnancy test before you start taking TABRECTA. This test must show that you are not pregnant.
Avoid becoming pregnant while you are taking TABRECTA. Use effective birth control during your treatment and for at least 7 days after your last dose of TABRECTA. Ask your healthcare professional about methods of birth control available to you.

Tell your healthcare professional right away if you become pregnant or think you may be pregnant during your treatment with TABRECTA.

- Do not breastfeed while you are taking TABRECTA and for at least 7 days after your last dose. It is not known if TABRECTA passes into breast milk.

**Male patients**
- You should not father a child while you are taking TABRECTA. It may harm your unborn baby.
- During your treatment with TABRECTA, use a condom each time you have sex with a woman who is pregnant, may be pregnant or could get pregnant. Continue using condoms for at least 7 days after your last dose.
- If, during your treatment with TABRECTA, your sexual partner becomes pregnant or thinks she may be pregnant, tell your healthcare professional right away.

**Photosensitivity (sensitivity to sunlight):** TABRECTA might cause you to be more sensitive to sunlight. Limit your exposure to the sun or ultraviolet (UV) light while taking TABRECTA. Use sunscreen, wear clothes that cover your skin, and avoid sunbathing while you are taking TABRECTA.

**Driving and using machines:** Before you drive or do tasks that require special attention, wait until you know how you respond to TABRECTA.

**Children and adolescents:** TABRECTA is NOT approved for use in children and adolescents under the age of 18 years.

**Check-ups and testing:** Your healthcare professional will do blood tests before and during treatment with TABRECTA. This is to check your liver, kidney and pancreas health.

Tell your healthcare professional about all the medicines you take, including any drugs, vitamins, minerals, natural supplements or alternative medicines.

The following may interact with TABRECTA:

- Grapefruit products;
- Medicines used to treat seizures such as carbamazepine, phenobarbital, phenytoin;
- St. John’s wort, a herbal product used to treat depression and other conditions;
- Medicines used to treat blood clots, such as dabigatran etexilate;
- Medicines used to treat gout, such as colchicine;
- Medicines used to treat diabetes, such as sitagliptin, saxagliptin;
- Medicines used to treat certain types of cancer or autoimmune diseases, such as methotrexate, mitoxantrone;
- Medicine used to treat bowel and rheumatic joint inflammation, such as sulfasalazine;
- Medicines used to treat tuberculosis, such as rifampicin;
- Antibiotics used to treat bacterial infections, such as telithromycin or clarithromycin;
- Medicines used to treat fungal infections, such as ketoconazole, itraconazole, posaconazole, voriconazole;
- Medicines used to treat HIV/AIDS, such as efavirenz, lopinavir/ritonavir, saquinavir, indinavir, or nelfinavir;
- Medicines used to treat hepatitis, such as telaprevir;
- Medicines used to treat depression, such as nefazodone;
- Medicines used to treat high blood pressure or heart problems, such as verapamil or digoxin;
- Medicines used to treat breathing problems, such as theophylline;
- Medicines used to treat muscle spasms, such as tizanidine;
- Medicines used to treat high cholesterol, such as rosuvastatin or pravastatin.

How to take TABRECTA:

- Take exactly as your healthcare professional has told you. Check with your healthcare professional if you are not sure.
- Do not change your dose or stop taking it unless your healthcare professional tells you to.
- Take TABRECTA for as long as your healthcare professional tells you to.
- Take TABRECTA twice a day at about the same time each day will help you to remember when to take your medicine.
- Swallow tablets whole. Do not break, chew, or crush the tablets.
- Take with or without food.

Usual dose:

Maximum Recommended Adult Dose:
- 400 mg twice a day. To make this dose, take two 200 mg tablets twice per day.

Your healthcare professional may lower your dose, stop your treatment for a period of time or recommend that you stop treatment completely. This may happen if you:
  - experience serious side effects, or
  - your disease gets worse.

Usual Reduced Adult Doses:
- 300 mg twice a day (two 150 mg tablets, twice a day), or
- 200 mg twice a day (one 200 mg tablet, twice a day)

Overdose:

If you think you, or a person you are caring for, have taken too much TABRECTA, contact a healthcare professional, hospital emergency department, or regional poison control centre immediately, even if there are no symptoms.

Missed Dose:

If you miss a dose or vomit after you have taken TABRECTA:

- Do not take a double dose to make up for a forgotten dose. Instead, wait until it is time for your next dose.
What are possible side effects from using TABRECTA?

These are not all the possible side effects you may have when taking TABRECTA. If you experience any side effects not listed here, tell your healthcare professional.

Side effects may include:
- Swollen hands, ankles, feet or face
- Nausea, vomiting
- Tiredness, weakness
- Shortness of breath
- Loss of appetite
- Diarrhea or constipation
- Cough
- Chest, stomach or back pain
- Fever
- Decreased weight
- Skin rash, hives
- Itchy skin with or without rash

TABRECTA can cause abnormal blood test results. Your healthcare professional will do blood tests before and during your treatment. These will tell your healthcare professional how TABRECTA is affecting your blood, liver, pancreas, kidneys and electrolyte levels.

If you have a troublesome symptom or side effect that is not listed here or becomes bad enough to interfere with your daily activities, tell your healthcare professional.

**Reporting Side Effects**

You can report any suspected side effects associated with the use of health products to Health Canada by:

- Visiting the Web page on Adverse Reaction Reporting ([https://www.canada.ca/en/health-canada/services/drugs-health-products/medeffect-canada.html](https://www.canada.ca/en/health-canada/services/drugs-health-products/medeffect-canada.html)) for information on how to report online, by mail or by fax; or
- Calling toll-free at 1-866-234-2345.

**NOTE:** Contact your health professional if you need information about how to manage your side effects. The Canada Vigilance Program does not provide medical advice.
Storage:

- Do not store above 25°C. Store in the original package to protect from moisture.
- Do not take this medicine if you notice any damage to the packaging or if there are any signs of tampering.
- Ask your healthcare professional on how to dispose of medicines you no longer use.
- Keep out of reach and sight of children.

If you want more information about TABRECTA:

- Talk to your healthcare professional
- Find the full product monograph that is prepared for healthcare professionals and includes this Patient Medication Information by visiting the Health Canada website: [https://www.canada.ca/en/health-canada/services/drugs-health-products/drug-products/drug-product-database.html](https://www.canada.ca/en/health-canada/services/drugs-health-products/drug-products/drug-product-database.html); the manufacturer’s website www.novartis.ca or by calling 1-800-363-8883.
