INCLUDING PATIENT MEDICATION INFORMATION

Pr **VYXEOS®**

Daunorubicin and cytarabine liposome for injection

Powder, 44 mg daunorubicin and 100 mg cytarabine per vial, intravenous infusion

Antineoplastic Agent

Jazz Pharmaceuticals Ireland Ltd
5th Floor, Waterloo Exchange
Waterloo Road
Dublin, Ireland D04 E5W7

Date of Initial Authorization:
APR 28, 2021

Date of Revision:
FEB 28, 2023

Imported by: Jazz Pharmaceuticals Canada Inc.
4080 Confederation Parkway, Suite 602
Mississauga, ON L5B 0G1

Submission Control Number: 262151

PART I: HEALTH PROFESSIONAL INFORMATION

1 INDICATIONS

VYXEOS® (daunorubicin and cytarabine liposome for injection) is indicated for:

- treatment of adults with newly diagnosed therapy-related acute myeloid leukemia (t-AML) or AML with myelodysplasia-related changes (AML-MRC).

1.1 Pediatrics

Pediatrics (< 18 years): Newly Diagnosed t-AML or AML-MRC: The safety and effectiveness of VYXEOS in the treatment of newly diagnosed t-AML or AML-MRC has not been established in children and adolescent patients under 18 years of age.

1.2 Geriatrics

Geriatrics (≥ 65 years of age): Evidence from clinical studies experience suggests there is no significant difference in the safety of VYXEOS in patients aged 65 or older. Dose adjustments based on age are not necessary [see [7.1.4 Special Populations – Geriatrics](#)].

2 CONTRAINDICATIONS

VYXEOS is contraindicated in patients who are:

- hypersensitive to this drug or to any ingredient in the formulation, including any non-medicinal ingredient, or component of the container. For a complete listing, see [6 DOSAGE FORMS, STRENGTHS, COMPOSITION AND PACKAGING](#).

3 SERIOUS WARNINGS AND PRECAUTIONS BOX

Serious Warnings and Precautions

VYXEOS has different dosage recommendations than daunorubicin hydrochloride injection, cytarabine injection, daunorubicin citrate liposome injection and cytarabine liposome injection. Verify drug name and dose prior to preparation and administration to avoid dosing errors [see [7 WARNINGS AND PRECAUTIONS](#)].

4 DOSAGE AND ADMINISTRATION

4.1 Dosing Considerations

- Treatment should be initiated and monitored under the supervision of a physician experienced in the use of chemotherapeutic medicinal products.
- VYXEOS has a different posology than daunorubicin injection and cytarabine injection

and it must not be interchanged with other daunorubicin and/or cytarabine containing products.

- Patients may be pre-medicated for nausea and vomiting. An anti-hyperuricemic therapy should be considered (e.g., allopurinol) prior to initiating VYXEOS.

4.2 Recommended Dose and Dosage Adjustment

VYXEOS dosing is based on individual patient's body surface area (BSA) according to the following schedule.

Adult Patients with Newly Diagnosed t-AML or AML-MRC

Table 1: Dose and Schedule for VYXEOS in Adult Patients with Newly Diagnosed t-AML or AML-MRC

Therapy	VYXEOS Dosing schedule
First induction	daunorubicin 44 mg/m ² and cytarabine 100 mg/m ² on days 1, 3 and 5
Second induction	daunorubicin 44 mg/m ² and cytarabine 100 mg/m ² on days 1 and 3
Consolidation	daunorubicin 29 mg/m ² and cytarabine 65 mg/m ² on days 1 and 3

Recommended Dosing Schedule for Induction of Remission

The recommended dosing schedule of VYXEOS is daunorubicin 44 mg/m² and cytarabine 100 mg/m² administered intravenously over 90 minutes:

- on days 1, 3 and 5 as the first course of induction therapy;
- on days 1 and 3 as subsequent course of induction therapy, if needed.

A subsequent cycle of induction may be administered 2 to 5 weeks after the first in patients who do not achieve remission and show no unacceptable toxicity. The attainment of a normal-appearing bone marrow may require more than one induction course. Evaluation of the bone marrow following recovery from the previous course of induction therapy determines whether a further course of induction is required. Treatment should be continued as long as the patient continues to benefit or until disease progression up to a maximum of 2 induction courses.

Recommended Dosing Schedule for Consolidation

The first consolidation course should be administered 5 to 8 weeks after the start of the last induction. The recommended dosing schedule of VYXEOS is daunorubicin 29 mg/m² and cytarabine 65 mg/m² administered intravenously over 90 minutes:

- on days 1 and 3 as subsequent courses of consolidation therapy, if needed.

Consolidation therapy is recommended for patients achieving remission who have recovered to absolute neutrophil count (ANC) > 0.5 x 10⁹/L and the platelet count has recovered to greater than 50 x 10⁹/L in the absence of unacceptable toxicity. A subsequent course of consolidation may be administered in patients who do not show disease progression or

unacceptable toxicity within the range of 5 to 8 weeks after the start of the first consolidation. Treatment should be continued as long as the patient continues to benefit or until disease progression, up to a maximum of 2 consolidation courses.

Recommended Dose Adjustments

Dosing should be delayed or permanently discontinued, if necessary, as described below.

Hypersensitivity Reactions

For hypersensitivity reactions of any grade/severity, interrupt VYXEOS infusion immediately and manage symptoms. Reduce the rate of infusion or discontinue treatment as outlined below:

- For mild hypersensitivity symptoms (e.g., mild flushing, rash, pruritus), the treatment should be stopped, and the patient should be supervised, including monitoring of vital signs. Once the symptoms have resolved, the treatment should be restarted slowly at half the prior rate of infusion and intravenous antihistamines and/or corticosteroids should be considered.
- For moderate hypersensitivity symptoms, do not reinitiate infusion. For subsequent doses of VYXEOS, premedicate with antihistamines and/or corticosteroids prior to initiating infusion at the same rate [see [7 WARNINGS AND PRECAUTIONS, Immune](#)].
- For severe or life-threatening symptoms, permanently discontinue VYXEOS treatment, treat according to the standard of care to manage symptoms. Monitor the patient until symptoms resolve [see [7 WARNINGS AND PRECAUTIONS, Immune](#)].

Cardiotoxicity

Assessment of cardiac function prior to the initiation of each cycle of induction and consolidation is recommended, especially in patients with a high risk of cardiac toxicity. VYXEOS treatment should be discontinued in patients who develop signs or symptoms of cardiomyopathy, unless the benefits outweigh the risks.

Renal impairment

Dose adjustment is not required for patients with mild (creatinine clearance [CrCL] 60 mL/min to 89 mL/min by Cockcroft Gault equation), moderate (CrCL 30 mL/min to 59 mL/min) or severe (CrCL 15 mL/min to 29 mL/min) renal impairment. There is no experience with VYXEOS in patients with end-stage renal disease managed with dialysis. Assessment of renal function prior to the initiation of each cycle of induction and consolidation is recommended. VYXEOS should only be used in patients with end-stage renal disease if the benefits outweigh the risks [see [7 WARNINGS AND PRECAUTIONS, Renal](#)].

Hepatic impairment

Dose adjustment is not required for patients with a bilirubin level less than or equal to 50 µmol/L. There is no experience with VYXEOS in patients with hepatic impairment resulting in a bilirubin level greater than 50 µmol/L. Assessment of hepatic function prior to the initiation of each cycle of induction and consolidation is recommended. VYXEOS should only be used in patients with severe hepatic impairment if the benefits outweigh the [see [7 WARNINGS AND PRECAUTIONS, Hepatic/Biliary](#)].

Elderly population

No dosage adjustment is required in elderly patients (≥ 65 years).

Pediatric population

Based on the data submitted and reviewed by Health Canada, the safety and efficacy of VYXEOS in pediatric patients has not been established; therefore, Health Canada has not authorized an indication for pediatric use [see [8.2.1 ADVERSE REACTIONS, Clinical Trial Adverse Reactions -Pediatrics](#)].

4.3 Reconstitution

VYXEOS is a cytotoxic medicinal product. Applicable special handling and disposal procedures should be followed. The product is intended for single use only. Do not save any unused portions for later administration.

Preparation Instructions

- Determine the dose based on daunorubicin and the individual patient's BSA as outlined in section [4.2 Recommended Dose and Dosage Adjustment](#).
- Calculate the number of vials of VYXEOS based on daunorubicin dose.
- Remove the appropriate number of vials of VYXEOS from the refrigerator and equilibrate to the room temperature for 30 minutes.
- Then, reconstitute each vial with 19 mL of sterile water for injections using a 20 mL sterile syringe, and immediately thereafter start a 5-minute timer.
- Carefully swirl the contents of the vial for 5 minutes while gently inverting the vial every 30 seconds.
- Do not heat, vortex, or shake vigorously.
- After reconstitution, let it rest for 15 minutes.
- The reconstituted product should be an opaque, purple, homogeneous dispersion, essentially free from visible particles.
- If the reconstituted product is not diluted into an infusion bag immediately, store in a refrigerator (2°C to 8°C) for up to 4 hours.
- Following the storage of reconstituted product in the vial for up to 4 hours at 2°C to 8°C, the reconstituted product must be immediately diluted into an infusion bag and run for the 90-minute infusion time.

- The maximum combined storage time for reconstituted product in the vial and reconstituted product diluted into an infusion bag is up to 4 hours (not 4 hours each) at 2°C to 8°C.
- Calculate the volume of reconstituted VYXEOS required using the following formula:

[volume required (mL) = dose of daunorubicin (mg/m²) x patient's BSA (m²)/2.2 (mg/mL)].

The concentration of the reconstituted solution is 44 mg/20 mL (2.2 mg/mL) daunorubicin and 100 mg/20 mL (5 mg/mL) cytarabine.

- Gently invert each vial 5 times prior to withdrawing the concentrate for dilution.
- Aseptically withdraw the calculated volume of reconstituted VYXEOS from the vial(s) with a sterile syringe and transfer it to an infusion bag containing 500 mL of sodium chloride 9 mg/mL (0.9%) solution for injection, or 5% glucose. There may be residual product remaining in the vial. Discard unused portion.
- Gently invert the bag to mix the solution. The dilution of the reconstituted product results in a deep purple, translucent, homogeneous dispersion.
- If the diluted infusion solution is not used immediately, store in a refrigerator (2°C to 8°C) for up to 4 hours.
- Gently invert the bag to mix the solution after refrigeration.

Table 2: Reconstitution

Vial Size	Volume of Diluent to be Added to Vial	Approximate Available Volume	Concentration per mL
50 mL vial	19 mL of Sterile Water	20 mL	Daunorubicin: 2.2 mg/mL Cytarabine: 5 mg/mL

4.4 Administration

VYXEOS is for intravenous use only. It must not be administered via an intramuscular, intrathecal or subcutaneous route.

VYXEOS is administered by intravenous infusion over a period of 90 minutes. Care should be taken to ensure there is no extravasation to prevent the risk of tissue necrosis.

Administration instructions:

- Do not mix VYXEOS with, or administer as an infusion with, other medicinal products.
- Administer VYXEOS by constant intravenous infusion over 90 minutes via an infusion pump through a central venous catheter or a peripherally inserted central catheter. An in-line membrane filter may be used for the intravenous infusion of VYXEOS liposomal, provided the minimum pore diameter of the filter is greater than or equal to 15 µm.
- Flush the line after administration with sodium chloride 9 mg/mL (0.9%) solution for injection.

4.5 Missed Dose

If a planned dose of VYXEOS is missed, administer the dose as soon as possible and adjust the dosing schedule accordingly, maintaining the treatment interval.

5 OVERDOSAGE

There is no specific experience in the management of overdose in patients. If overdose occurs, exacerbation of adverse reactions associated with VYXEOS are expected and supportive treatment (including anti-infectives, blood and platelet transfusions, colony-stimulating factors, and intensive care as needed) should be provided until the patient recovers. Observe the patient carefully over time for signs of cardiotoxicity and provide appropriate supportive therapy as clinically indicated.

For management of a suspected drug overdose, contact your regional poison control centre.

6 DOSAGE FORMS, STRENGTHS, COMPOSITION AND PACKAGING

Table 3: Dosage Forms, Strengths, Composition and Packaging

Route of Administration	Dosage Form/ Strength/Composition	Non-medicinal Ingredients
Intravenous infusion	Powder. Each vial contains 44 mg of daunorubicin and 100 mg of cytarabine. After reconstitution the solution contains 2.2 mg/mL daunorubicin and 5 mg/mL cytarabine encapsulated in liposomes in a fixed combination in a 1:5 molar ratio.	Cholesterol, copper gluconate, distearoylphosphatidylcholine, distearoylphosphatidylglycerol, sucrose, triethanolamine (for pH adjustment).

VYXEOS is a sterile, preservative-free, purple, lyophilized cake for reconstitution supplied in a single-dose clear glass vial.

Each pack size contains 1 vial, 2 vials or 5 vials. Not all pack sizes may be marketed.

7 WARNINGS AND PRECAUTIONS

General

Other Daunorubicin and/or Cytarabine-containing Products

VYXEOS must not be substituted or interchanged with other daunorubicin and/or cytarabine-containing products. Due to substantial differences in the pharmacokinetic parameters, the

dose and schedule recommendations for VYXEOS are different from those for daunorubicin hydrochloride injection, cytarabine injection, daunorubicin citrate liposome injection, and cytarabine liposome injection. The medicinal product name and dose should be verified prior to administration to avoid dosing errors.

Tissue necrosis

Daunorubicin has been associated with local tissue necrosis at the site of medicinal product extravasation. In clinical studies with VYXEOS, one event of extravasation occurred, but no necrosis was observed. Care should be taken to ensure that there is no extravasation of medicinal product when VYXEOS is administered. VYXEOS should be administered intravenously only. Do not administer by intramuscular, intrathecal or subcutaneous route [[see 4.4 DOSAGE AND ADMINISTRATION, Administration](#)].

Cardiovascular

Cardiotoxicity is a known risk of anthracycline treatment. Prior therapy with anthracyclines, pre-existing cardiac disease (including impaired cardiac function), previous radiotherapy of the mediastinum, or concomitant use of cardiotoxic products may increase the risk of daunorubicin-induced cardiac toxicity. A baseline cardiac evaluation with an electrocardiogram (ECG) and a multi-gated radionuclide angiography (MUGA) scan or an echocardiography (ECHO) is recommended, especially in patients with risk factors for increased cardiac toxicity. Repeat MUGA or ECHO determinations of left ventricular ejection fraction (LVEF) prior to consolidation with VYXEOS and as clinically required. VYXEOS treatment is not recommended in patients with LVEF that is less than normal.

Total cumulative doses of non-liposomal daunorubicin greater than 550 mg/m² have been associated with an increased incidence of treatment-induced congestive heart failure. This limit appears lower (400 mg/m²) in patients who received radiation therapy to the mediastinum. Calculate the lifetime cumulative anthracycline exposure prior to each cycle of VYXEOS. VYXEOS treatment is not recommended in patients whose lifetime anthracycline exposure has reached the maximum cumulative limit.

The cumulative exposure of daunorubicin per cycle of VYXEOS is shown in Table 4.

Table 4: Cumulative Exposure of Daunorubicin per Cycle of VYXEOS

Therapy	Daunorubicin per dose	Number of doses per course	Daunorubicin per course
First induction	44 mg/m ²	3	132 mg/m ²
Second induction	44 mg/m ²	2	88 mg/m ²
Each consolidation	29 mg/m ²	2	58 mg/m ²

Treatment with VYXEOS should be discontinued in patients with impaired cardiac function unless the benefit of initiating or continuing treatment outweighs the risk [see [9 DRUG INTERACTIONS](#) and [8 ADVERSE REACTIONS](#)].

Driving and Operating Machinery

VYXEOS has minor influence on the ability to drive and use machines. Fatigue and dizziness have been reported with the use of VYXEOS. Therefore, caution is recommended when driving or operating machines.

Endocrine and Metabolism

Each vial of VYXEOS contains 100 mg of copper gluconate, which corresponds to 14 mg of elemental copper. There is no clinical experience with VYXEOS in patients with Wilson's disease or other copper-related metabolic disorders. The maximum theoretical total exposure of copper under the recommended VYXEOS dosing regimen is 106 mg/m². Consult with a hepatologist and nephrologist with expertise in managing acute copper toxicity in patients with Wilson's disease treated with VYXEOS. Monitor total serum copper, serum non-ceruloplasmin bound copper, 24-hour urine copper levels and serial neuropsychological examinations in these patients. VYXEOS should be used in patients with a history of Wilson's disease or other copper-related disorder only if the benefits outweigh the risks. Discontinue VYXEOS in patients with signs or symptoms of acute copper toxicity.

Gastrointestinal

It should be taken into consideration that the absorption of oral accompanying medicinal products may be considerably influenced by gastrointestinal mucositis and/or diarrhea frequently occurring in association with intensive chemotherapy.

Hematologic

Severe myelosuppression resulting in fatal infections and hemorrhage has been reported in patients after administration of a therapeutic dose of VYXEOS. Serious or fatal hemorrhagic events, including fatal central nervous system (CNS) hemorrhages, associated with severe thrombocytopenia, have occurred in patients treated with VYXEOS. Due to the long plasma half-life of VYXEOS, time to recovery of absolute neutrophil count (ANC) and platelets may be prolonged and require additional monitoring [see [Monitoring and Laboratory Tests](#)].

Prophylactic anti-infectives (including anti-bacterial, anti-virals, anti-fungals) may be administered during the period of profound neutropenia until ANC returns to 500/μL or greater. If myelosuppressive complications occur, appropriate supportive measures should be used, e.g., anti-infectives, growth factors (such as erythropoiesis stimulating agents or granulocyte colony-stimulating factors, and platelet transfusions. Blood counts should be regularly monitored until recovery [see [8 ADVERSE REACTIONS](#)].

Hepatic/Biliary

Hepatic impairment may increase the risk of toxicity associated with daunorubicin and cytarabine. Evaluation of hepatic function using conventional clinical laboratory tests is recommended prior to administration of VYXEOS and periodically during treatment. There is no experience with VYXEOS in patients with baseline serum bilirubin greater than 50 µmol/L. VYXEOS should only be used in patients with severe hepatic impairment if the benefits outweigh the risks [see [4.2 Recommended Dose and Dosage Adjustment](#)].

Immune

Serious hypersensitivity reactions, including anaphylactic reactions, have been reported with daunorubicin and cytarabine.

For moderate hypersensitivity symptoms (e.g., moderate rash, flushing, mild dyspnoea, chest discomfort) stop the infusion and treat according to standard care. The infusion should not be restarted. When the patient is retreated, VYXEOS should be given at the same dose and rate and with premedication.

For severe/life-threatening hypersensitivity symptoms (e.g., hypotension requiring vasopressor therapy, angioedema, respiratory distress requiring bronchodilation therapy, generalised urticaria), permanently discontinue VYXEOS, treat according to standard of care and monitor until signs and symptoms resolve [see [4.2 Recommended Dose and Dosage Adjustment](#) and [8 ADVERSE REACTIONS](#)].

Immunosuppressant Effects/Increased Susceptibility to Infections

Administration of live or live-attenuated vaccines in patients that are immunocompromised by chemotherapeutic agents may result in serious or fatal infections. Vaccination with a live vaccine should be avoided in patients receiving VYXEOS. Killed or inactivated vaccines may be administered; however, the response to such vaccines may be diminished.

Monitoring and Laboratory Tests

Cardiac function should be closely monitored. MUGA or ECHO determinations of left ventricular ejection fraction (LVEF) required prior to initiation of treatment with VYXEOS, repeated prior to consolidation with VYXEOS and as clinically required.

Baseline assessment of blood counts should be obtained, and patients should be carefully monitored during treatment with VYXEOS for neutropenia, thrombocytopenia and anemia due to myelosuppression.

VYXEOS may induce hyperuricemia secondary to rapid lysis of leukemic cells. Blood uric acid levels should be monitored, and appropriate therapy initiated if hyperuricemia develops.

Renal

Renal impairment may increase the risk of toxicity associated with daunorubicin and cytarabine. Evaluation of renal function using conventional clinical laboratory tests is recommended prior to administration of VYXEOS and periodically during treatment. There is no experience with VYXEOS in patients with end-stage renal disease managed with dialysis. VYXEOS should only be used in patients with end-stage renal disease if the benefits outweigh the risks [see [4.2 Recommended Dose and Dosage Adjustment](#)].

Reproductive Health: Female and Male Potential

Patients should be advised to avoid becoming pregnant while receiving VYXEOS. Male patients and women of childbearing potential must use an effective method of contraception during treatment and for 6 months following the last dose of VYXEOS. If this drug is used during pregnancy or if the patient becomes pregnant while taking this drug, apprise the patient of the potential risks to the fetus [see [7.1.1 Special Populations – Pregnant Women and 16 NON-CLINICAL TOXICOLOGY](#)]

- **Fertility**

Based on findings from animal studies with cytarabine and daunorubicin, male fertility may be compromised by treatment with VYXEOS [see [16 NON-CLINICAL TOXICOLOGY](#)].

7.1 Special Populations

7.1.1 Pregnant Women

There are no data on the use of VYXEOS in pregnant women. Based on results from animal studies and its mechanism of action, VYXEOS should not be used during pregnancy, unless the clinical condition of the woman requires treatment and justifies the potential risks to the fetus [see [16 NON-CLINICAL TOXICOLOGY](#)].

If the medicinal product is used during pregnancy, or if the patient becomes pregnant while receiving VYXEOS, the woman should be informed of the potential hazard to the fetus. In any case, cardiologic examination and a blood count are recommended in fetuses and newborns born to mothers who received treatment during pregnancy [see [7.1.1 Special Populations – Pregnant Women and 16 NON-CLINICAL TOXICOLOGY](#)].

Women of childbearing potential/Contraception in males and females

Women of childbearing potential should avoid becoming pregnant while receiving VYXEOS. Women of childbearing potential should use effective contraception while they or their male partner undergo treatment. Women of childbearing potential should not receive VYXEOS until pregnancy is excluded.

Women of childbearing potential should undergo pregnancy testing before initiation of VYXEOS. Men with sexual partners of reproductive potential and women should use effective

contraception during treatment and for 6 months following the last dose of VYXEOS.

7.1.2 Breast-feeding

It is not known whether VYXEOS is excreted in human milk. Because of the potential for serious adverse reactions in breast feeding children from VYXEOS, mothers should be advised not to breastfeed during VYXEOS therapy.

7.1.3 Pediatrics

Pediatrics (1 to < 18 years): Based on the data submitted and reviewed by Health Canada, the safety and efficacy of VYXEOS in pediatric patients has not been established; therefore, Health Canada has not authorized an indication for pediatric use [see [1 INDICATIONS](#) and [4 DOSAGE AND ADMINISTRATION](#)].

In a single arm study of anthracycline pre-treated children with relapsed AML, baseline abnormalities in cardiovascular function were common. VYXEOS was associated with a decline in cardiovascular function. There is no pediatric safety data to address long-term cardiotoxicity of VYXEOS when used at doses above the maximum life-time cumulative anthracycline dose. Warnings applicable to adults are also relevant to pediatric use [see [8 ADVERSE REACTIONS](#)].

7.1.4 Geriatrics

Of the 375 patients who received VYXEOS in clinical studies, 57% were 65 years and over. No overall differences in safety were observed between these patients and younger patients, with the exception of bleeding events, which occurred more frequently in patients 65 years and older compared to younger patients (77% vs. 59%).

8 ADVERSE REACTIONS

8.1 Adverse Reaction Overview

Study 301 in Patients with Newly Diagnosed t-AML or AML-MRC

The safety of VYXEOS was determined in a randomized trial for adults with newly-diagnosed t-AML or AML-MRC [see [14 CLINICAL TRIALS](#)] which included 153 patients treated with VYXEOS and 151 patients treated with a standard combination of cytarabine and daunorubicin (7+3). At study entry, patients were required to have a LVEF of at least 50% and a prior lifetime cumulative anthracycline exposure less than 368 mg/m² daunorubicin (or equivalent). On study, the median number of cycles administered was 2 (range, 1–4 cycles) on the VYXEOS arm and 1 (range, 1–4 cycles) on the control arm. The median cumulative daunorubicin dose was 189 mg/m² (range, 44–337 mg/m²) on the VYXEOS arm and 186 mg/m² (range, 44–532 mg/m²) on the control arm. Safety data were collected for adverse events which started after the first dose of induction 1 and not more than 30 days after the last dose date. Of the adverse events reported those that were treatment related were adverse reactions.

Nine patients each on the VYXEOS arm (6%) and the control arm (6%) had a fatal adverse reaction on treatment or within 30 days of therapy that was not in the setting of progressive disease. Fatal adverse reactions on the VYXEOS arm included infection, CNS hemorrhage and respiratory failure. Overall, all-cause day-30 mortality was 6% in the VYXEOS arm and 11% in the control arm. During the first 60 days of the study, 14% (21/153) of patients died in the VYXEOS arm vs. 21% (32/151) of patients in the 7+3 treatment group.

The most common serious adverse reactions (incidence $\geq 5\%$) on the VYXEOS arm were dyspnea, myocardial toxicity, sepsis, pneumonia, febrile neutropenia, bacteremia and hemorrhage. Adverse reactions led to discontinuation of VYXEOS in 18% (28/153) of patients, and 13% (20/151) in the control arm. The adverse reactions leading to discontinuation on the VYXEOS arm included prolonged cytopenias, infection, cardiotoxicity, respiratory failure, hemorrhage (GI and CNS), renal insufficiency, colitis and generalized medical deterioration. The incidences of common adverse drug reactions during the induction phase in Study 301 are presented in Table 5.

Data from Pooled Safety Analysis

Among the 375 patients treated with VYXEOS in adult clinical trials, the most frequently occurring adverse reactions (ADRs) were hypersensitivity including rash (66.9%), febrile neutropenia (63.5%), oedema (52.3%), nausea (51.7%), diarrhoea/colitis (49.9%), mucositis (49.9%), fatigue (46.4%), musculoskeletal pain (44.5%), constipation (42.7%), abdominal pain (36.3%), decreased appetite (33.9%), cough (33.9%), headache (32.3%), chills (31.2%), arrhythmia (30.4%), pyrexia (29.6%), vomiting (27.7%), sleep disorders (25.1%) and hypotension (23.7%).

The most serious (Grades 3-5) and frequently occurring ADRs were febrile neutropenia (62.4%), infection (58.7%), cardiotoxicity (18.7%), dyspnoea (13.1%), hemorrhage (13.1%) and fatigue (10.4%).

8.2 Clinical Trial Adverse Reactions

Clinical trials are conducted under very specific conditions. The adverse reaction rates observed in the clinical trials; therefore, may not reflect the rates observed in practice and should not be compared to the rates in the clinical trials of another drug. Adverse reaction information from clinical trials may be useful in identifying and approximating rates of adverse drug reactions in real-world use.

Table 5: Common Adverse Reactions (≥ 10% Incidence in the VYXEOS arm) During the Pivotal Study 301 Induction Phase

System Organ Class	All Grades ^a		Grades 3 to 5 ^a	
	VYXEOS N=153 n (%)	7+3 N=151 n (%)	VYXEOS N=153 n (%)	7+3 N=151 n (%)

^aAdverse reactions were graded using NCI CTCAE version 3.0.

Infections

Due to the neutropenia experienced with VYXEOS, infections of various types were very common ADRs. Pneumonia, sepsis and bacteremia were the most frequently seen serious infection ADRs in the pooled clinical studies population. The incidence of infection events was 78.1%; the incidence of non-serious events of infections was 73.1%, the incidence of serious events of infections was 28.5%; the incidence of infections which led to discontinuation is 0.5%. The incidence of fatal infections was 6.9%. The fatal infections experienced were sepsis and pneumonia [see [7 WARNINGS AND PRECAUTIONS – Hematologic](#)].

Hemorrhage

Due to the thrombocytopenia experienced with VYXEOS a variety of hemorrhagic events were seen in the pooled clinical studies. The most common hemorrhagic event was epistaxis, and the majority of these were considered not serious (29.6%). The incidence of hemorrhage events is 69.1%; the incidence of non-serious events of hemorrhage was 67.2%; the incidence of serious events of hemorrhage is 5.6%; the incidence of hemorrhage which led to discontinuation is 0. The incidence of fatal hemorrhage was 2.1%. Serious or fatal hemorrhagic events, including fatal central nervous system (CNS) hemorrhages, associated with severe thrombocytopenia were seen in patients treated with VYXEOS [see [7 WARNINGS AND PRECAUTIONS – Hematologic](#)].

Cardiotoxicity

Cardiotoxicities were seen in VYXEOS in pooled clinical studies. The most frequently reported serious ADRs were decreased ejection fraction and congestive cardiac failure. Cardiotoxicity is a known risk of anthracycline treatment. The incidence of all cardiotoxicity events was 72.0%; the incidence of non-serious events of cardiotoxicity was 68.5%; the incidence of serious events of cardiotoxicity was 9.1%; the incidence of cardiotoxicity which led to discontinuation is 0.5%. Incidence of fatal cardiotoxicity events is 0.5%. Cardiac arrest was reported as a fatal event; the patient experienced thrombocytopenia and neutropenia which contributed to cardiac arrest [see [7 WARNINGS AND PRECAUTIONS – Cardiovascular](#)].

Hypersensitivity

Hypersensitivity reactions were very common ADRs in VYXEOS in the pooled clinical studies. The most frequently reported hypersensitivity ADRs were rash and the majority of these were not serious (38.9%). The incidence of all hypersensitivity events was 66.9%; the incidence of non-serious events of hypersensitivity was 66.4%, of which 38.9% were rash; the incidence of serious events of hypersensitivity is 1.1%; the frequency of hypersensitivity which led to discontinuation is 0. The frequency of fatal hypersensitivity events was 0 [see [7 WARNINGS AND PRECAUTIONS – Immune](#)].

8.2.1 Clinical Trial Adverse Reactions – Pediatrics

Pediatric population

In a single arm study of 38 anthracycline pre-treated children with relapsed AML, baseline abnormalities in cardiovascular function were common compared to a pooled analysis in 375 adult patients with newly diagnosed tAML or AML-MRC and 125 patients from an additional adult study in second-line treatment. VYXEOS was associated with a decline in cardiovascular function. The early onset of cardiotoxicity (defined as > 10% decrease LVEF to final LVEF < 50% LVEF) was reported in 21% of pediatric patients as compared to 11% of VYXEOS-treated older adults with newly diagnosed AML. There is no pediatric safety data to address long-term cardiotoxicity of VYXEOS when used at doses above the maximum life-time cumulative anthracycline dose. Adverse events (AEs) observed in children that were different from or more severe than those seen in adults (in both first- and second-line settings) included rash maculo-papular at 47.4% (any grade) (42.1% Grade ≥ 3, 15.8% serious AE) in children as compared to 9.6% (any grade) in adults. Electrocardiogram QT prolongation was monitored without any corrections in the pediatric study and was prolonged in 28.9% of children compared to 0.8% in adults [see [10.2 CLINICAL PHARMACOLOGY – Pharmacodynamics](#)]. The rates of severe (Grade ≥ 3) AEs in pediatric and adult patients for Hypokalemia were 13.2% vs 8.6% (first-line setting) and 0% (second-line settings); Hyperglycaemia (7.9% vs 0% and 0%) and ALT increased (7.9% vs 1.2% and 0%) were higher in children than in adults (in both first and second-line settings), respectively.

8.3 Less Common Clinical Trial Adverse Reactions

Other notable adverse drug reactions that occurred in the pooled analysis treated with VYXEOS during induction or consolidation included:

- Ear and labyrinth disorders: Deafness, Deafness unilateral
- Eye Disorders: Eye conjunctivitis, Dry eye, Eye edema, Eye swelling, Eye irritation, Eye pain, Ocular discomfort, Ocular hyperemia, Periorbital edema, Scleral hyperemia
- Endocrine disorders: Hypothyroidism
- Psychiatric disorders: Hallucinations
- Respiratory, thoracic and mediastinal disorders: Pneumonitis

8.4 Abnormal Laboratory Findings: Hematologic, Clinical Chemistry and Other Quantitative Data

Clinical Trial Findings

All patients developed severe neutropenia, thrombocytopenia and anemia. See Table 6 for the incidences of Grade 3 thrombocytopenia and Grade 4 neutropenia that were prolonged in the absence of active leukemia.

Table 6: Prolonged Cytopenias for Patients in Study 1

	Induction 1		Consolidation 1 ^b

8.5 Post-Market Adverse Reactions

Not available.

9 DRUG INTERACTIONS

9.2 Drug Interactions Overview

No interaction studies have been performed with VYXEOS. The delivery of daunorubicin and cytarabine in the VYXEOS liposomal formulation is anticipated to reduce the possibility of interactions, because systemic free-drug concentrations of daunorubicin and cytarabine are much lower than when administered as the non-liposomal formulation.

9.3 Drug-Behavioural Interactions

No interaction studies have been performed.

9.4 Drug-Drug Interactions

The drugs listed in this table are based on either drug interaction case reports or studies, or potential interactions due to the expected magnitude and seriousness of the interaction (i.e., those identified as contraindicated).

Table 8: Established or Potential Drug-Drug Interactions

Drug class	Source of Evidence	Effect	Clinical comment
Cardiotoxic agents, such as doxorubicin	T	Concomitant use of cardiotoxic agents may increase the risk of cardiotoxicity.	Use of VYXEOS in patients who have previously received doxorubicin increases the risk of cardiotoxicity (see section 7.2). Do not administer VYXEOS in combination with other cardiotoxic agents unless the patient's cardiac function is closely monitored.

Drug class	Source of Evidence	Effect	Clinical comment
Hepatotoxic agents	T	Hepatotoxic medicinal products may impair liver function and increase the toxicity.	Since daunorubicin is metabolised by the liver, changes in hepatic function induced by concomitant therapies may affect metabolism, pharmacokinetics, therapeutic efficacy and/or the toxicity of VYXEOS. Hepatic function should be monitored more frequently when VYXEOS is co-administered with hepatotoxic agents.

T = Theoretical

9.5 Drug-Food Interactions

No interaction studies have been performed.

9.6 Drug-Herb Interactions

No interaction studies have been performed.

9.7 Drug-Laboratory Test Interactions

No interaction studies have been performed.

10 CLINICAL PHARMACOLOGY

10.1 Mechanism of Action

VYXEOS (daunorubicin and cytarabine liposome for injection) is a combination of daunorubicin and cytarabine in a 1:5 molar ratio encapsulated in liposomes for intravenous administration. The 1:5 molar ratio has been shown *in vitro* and *in vivo* to maximise synergistic antitumour activity in AML. The liposome membrane is composed of distearoylphosphatidylcholine (DSPC), distearoylphosphatidylglycerol (DSPG) and cholesterol in a 7:2:1 molar ratio.

Daunorubicin has antimitotic and cytotoxic activity, which is achieved by forming complexes with DNA, inhibiting topoisomerase II activity, inhibiting DNA synthesis activity, affecting regulation of gene expression and producing DNA-damaging free radicals.

Cytarabine is a cell cycle phase-specific antineoplastic agent, affecting cells only during the S-phase of cell division. Intracellularly, cytarabine is converted into cytarabine-5-triphosphate

(ara-CTP), which is the active metabolite. The mechanism of action is not completely understood, but it appears that ara-CTP acts primarily through inhibition of DNA synthesis. Incorporation into DNA and RNA may also contribute to cytarabine cytotoxicity. Cytarabine is cytotoxic to proliferating mammalian cells in culture.

VYXEOS liposomes exhibit a prolonged plasma half-life following intravenous infusion, with greater than 99% of the daunorubicin and cytarabine in the plasma remaining encapsulated within the liposomes. VYXEOS delivers a synergistic combination of daunorubicin and cytarabine to leukemia cells for a prolonged period of time. Based on animal data, VYXEOS liposomes accumulate and persist in high concentration in the bone marrow, where they are preferentially taken up intact by leukemia cells in an active engulfment process. In leukemia-bearing mice, the liposomes are taken up by leukemia cells to a greater extent than by normal bone marrow cells. After internalization, VYXEOS liposomes undergo degradation releasing daunorubicin and cytarabine within the intracellular environment, enabling the medicinal products to exert their synergistic antineoplastic activity.

10.2 Pharmacodynamics

Cardiac electrophysiology

The effect of VYXEOS on cardiac repolarisation following the first induction cycle as determined by the Fridericia's corrected QT-interval (QTcF) was evaluated in an open-label, single arm study in 26 patients who received VYXEOS 100 mg/m² on days 1, 3 and 5. No patients had QTcF changes from baseline more than 60 msec, and no QTcF values were greater than 500 msec, indicating absence of risk for prolongation of the QT interval.

10.3 Pharmacokinetics

Table 9: Summary of the Pharmacokinetic Parameters of Daunorubicin and Cytarabine in Liposomes in Patients with AML

	V (L) (CV%)	CL (L/h) (CV%)	T _{1/2} (h) (CV%)
Cytarabine	7.11 (49.2)	0.131 (60.2)	40.4 (24.2)
Daunorubicin	6.64 (36.8)	0.163 (53.3)	31.5 (28.5)

Abbreviations: CL = clearance; t_{1/2} = terminal half-life; V = volume of distribution

Parallel plasma concentration-time profiles were observed for daunorubicin and cytarabine and mean daunorubicin:cytarabine molar ratios in the plasma remained close to the desired synergistic ratio of 1:5 for 24 hrs.

Published data suggest non-liposomal daunorubicin and cytarabine have markedly different PK parameters from one another. In contrast, when administered as components of VYXEOS, the PK parameters for daunorubicin and cytarabine, respectively, are similar. The convergence of PK parameters with VYXEOS suggests that most of the daunorubicin and cytarabine in the circulation remains trapped within the liposomes. Therefore, the measured PK parameters for daunorubicin and cytarabine following VYXEOS administration mostly reflect the PK of the liposomes.

The pharmacokinetics of daunorubicin and cytarabine administered as VYXEOS were investigated in adult patients who received a dose of daunorubicin 44 mg/m² and cytarabine 100 mg/m² administered as a 90-minute intravenous infusion on days 1, 3 and 5. The pharmacokinetics of each medicinal product was based on total plasma concentrations (i.e., encapsulated plus un-encapsulated medicinal product).

Following the dose administered on day 5, the mean (% coefficient of variation [CV]) maximum plasma concentration (C_{max}) for daunorubicin was 26.0 (32.7%) µg/mL and cytarabine was 62.2 (33.7%) µg/mL. The mean (%CV) area under the curve (AUC) during one dosing interval for daunorubicin was 637 (38.4%) µg•h/mL and cytarabine was 1900 (44.3%) µg•h/mL.

When daunorubicin and cytarabine are administered as components of VYXEOS, the liposomes appear to govern their tissue distribution and rates of elimination; therefore, while the non-liposomal medicinal products have markedly different clearance (CL), volume of distribution (V) and terminal half-life (t_{1/2}), VYXEOS causes these pharmacokinetic parameters to converge.

The accumulation ratio was 1.3 for daunorubicin and 1.4 for cytarabine. There was no evidence of time-dependent kinetics or clinically relevant departures from dose proportionality over the range of 1.3 mg/3 mg per m² to 59 mg/134 mg per m² (0.03 to 1.3 times the approved recommended dose).

Distribution: The volume of distribution (%CV) for daunorubicin is 6.6 L (36.8%) and cytarabine is 7.1 L (49.2%). Plasma protein binding was not evaluated.

Metabolism: Similar to non-liposomal daunorubicin and cytarabine, subsequent to release from VYXEOS liposomes, both daunorubicin and cytarabine are extensively metabolised in the body. Daunorubicin is mostly catalysed by hepatic and non-hepatic aldo-keto reductase and carbonyl reductase to the active metabolite daunorubicinol. Cytarabine is metabolised by cytidine deaminase to the inactive metabolite 1-β (beta)-D-arabinofuranosyluracil (AraU).

Unlike non-liposomal daunorubicin and cytarabine, which are quickly metabolised to the respective metabolites, daunorubicin and cytarabine after VYXEOS administration are free bases encapsulated in liposomes. Plasma concentration-time profiles obtained from 13 to 26 patients who received VYXEOS 100 units/m² (equivalent to 44 mg/m² of daunorubicin and 100 mg/m² of cytarabine) on days 1, 3 and 5 show the mean AUC_{last} metabolite: parent ratio for daunorubicinol and AraU were 1.79% and 3.22% to that for daunorubicin and cytarabine, respectively; which are lower than those typically reported for non-liposomal products, ~40-60% for daunorubicinol:daunorubicin and ~80% for AraU:cytarabine. The lower percentages of metabolite:parent ratios after VYXEOS administration indicate that most of the total daunorubicin and cytarabine in the circulation is trapped inside the VYXEOS liposomes, where they are inaccessible to medicinal product-metabolising enzymes.

Elimination: VYXEOS exhibits a prolonged half-life (%CV) of 31.5 h (28.5%) for daunorubicin and 40.4 h (24.2%) for cytarabine with greater than 99% of the daunorubicin and cytarabine in the plasma remaining encapsulated within the liposomes. The clearance (%CV) is 0.16 L/h

(53.3%) for daunorubicin and 0.13 L/h (60.2%) for cytarabine.

Urinary excretion of daunorubicin and daunorubicinol accounts for 9% of the administered dose of daunorubicin, and urinary excretion of cytarabine and AraU accounts for 71% of the administered dose of cytarabine.

Special Populations and Conditions

No clinically meaningful effects on the pharmacokinetics of daunorubicin and cytarabine were observed based on age (1 to 81 years), sex, race, body weight, body mass index and white blood cell count after adjusting dose by body surface area.

Pediatrics: The pharmacokinetics of VYXEOS in pediatric and young adult (aged 1 to 21 years old) patients with relapsed or refractory AML were examined at a dose of daunorubicin 59 mg/m² and cytarabine 135 mg/m² administered intravenously, in studies AAML1421 and CPX-MA-1201. The exposures of daunorubicin and cytarabine observed in pediatrics and young adults were within the values observed in adults given the same dose based on body surface area.

Geriatrics: The pharmacokinetics of VYXEOS in patients aged > 85 years has not yet been evaluated. No data are available.

Sex: Gender does not have a clinically important effect on the exposure of total daunorubicin or cytarabine after adjusting dose by body surface area.

Pregnancy and Breast-feeding: Based on animal data in daunorubicin and cytarabine, VYXEOS can cause fetal harm when administered to pregnant women. There are no adequate and well-controlled studies of VYXEOS, daunorubicin or cytarabine in pregnant women. Daunorubicin and cytarabine are reproductive and developmental toxicants in multiple species (mice, rats and/or dogs).

It is not known whether VYXEOS is excreted in human milk. Because many medicinal products are excreted in human milk and because of the potential for serious adverse reactions in nursing children from VYXEOS, mothers should be advised not to breastfeed during VYXEOS therapy.

Genetic Polymorphism: Not determined.

Ethnic Origin: Race does not have a clinically important effect on the exposure of total daunorubicin or cytarabine after adjusting dose by body surface area.

Hepatic Insufficiency: The pharmacokinetics of total daunorubicin and cytarabine were not altered in patients with bilirubin ≤ 50 µmol/L. The pharmacokinetics in patients with bilirubin greater than 50 µmol/L is unknown.

Renal Insufficiency: Based on a population pharmacokinetic analysis using data from clinical studies in patients and a dedicated renal impairment study to evaluate the potential impact of mild to severe renal impairment on the pharmacokinetics and safety of VYXEOS, no significant difference in clearance of daunorubicin or cytarabine was observed in patients with pre-existing mild (creatinine clearance [CrCL] 60 mL/min to 89 mL/min by Cockcroft Gault equation), moderate (CrCL 30 mL/min to 59 mL/min) or severe (CrCL 15 mL/min to 29 mL/min) renal impairment compared to patients with baseline normal renal function (CrCL \geq 90 mL/min). The potential effects of end-stage renal disease managed with dialysis on the pharmacokinetics of daunorubicin and cytarabine administered as VYXEOS are unknown.

Obesity: Body weight and body mass index do not have a clinically important effect on the exposure of total daunorubicin or daunorubicin after adjusting dose by body surface area.

11 STORAGE, STABILITY AND DISPOSAL

Unopened Vials

Store in a refrigerator (2°C to 8°C).

Keep the vial in the original carton in order to protect from light. Store in an upright position.

Stability of Reconstituted Suspension in the Vial

Chemical and physical in-use stability has been demonstrated for 4 hours at 2°C to 8°C when kept in an upright position.

Stability of Diluted Infusion Solution

Chemical and physical in-use stability has been demonstrated for 4 hours at 2°C to 8°C.

From a microbiological point of view, unless the method of opening/reconstitution/dilution precludes the risk of microbial contamination, the product should be used immediately.

If not used immediately, in-use storage times and conditions are the responsibility of the user.

12 SPECIAL HANDLING INSTRUCTIONS

VYXEOS is a cytotoxic drug. Follow applicable special handling and disposal procedures.

If there are signs of leakage, crystallization or any damage on the vial or the reconstituted infusion bag then the product should not be used and be discarded.

PART II: SCIENTIFIC INFORMATION

13 PHARMACEUTICAL INFORMATION

Drug Substance

Daunorubicin

Proper name: Daunorubicin hydrochloride

Chemical name: (1S,3S)-3-acetyl-1,2,3,4,6,11-hexahydro-3,5,12-trihydroxy-10-methoxy-6,11-dioxo-1-naphthacenyl-3-amino-2,3,6-trideoxy- α -L-lyxo-hexopyranoside hydrochloride

Molecular formula and molecular mass: $C_{27}H_{29}NO_{10} \cdot HCl$; 563.98 g/mol

Structural formula:

Physicochemical properties: Orange-red crystalline powder.

Freely soluble in water and in methanol, slightly soluble in alcohol, practically insoluble in acetone.

Melting point: 208-209°C

Daunorubicin is present as a free base encapsulated in liposomes.

Cytarabine

Proper name: Cytarabine

Chemical name: 4-amino-1- β -D-arabinofuranosyl-2(1H)-pyrimidinone

Molecular formula and molecular mass: $C_9H_{13}N_3O_5$; 243.2 g/mol

Structural formula:

Physicochemical properties: White to off-white crystalline powder.

Freely soluble in water, very slightly soluble in alcohol and in methylene chloride.

Melting point: About 215°C

14 CLINICAL TRIALS

14.1 Trial Design and Study Demographics

Study 301 in Patients with Newly Diagnosed t-AML or AML-MRC

Study 301 was a Phase 3 randomized, multicentre, open-label, parallel-arm, superiority study which evaluated VYXEOS vs. a standard combination of daunorubicin and cytarabine (7+3) in 309 patients between 60 to 75 years of age with untreated high-risk AML. Patients with the following AML sub-types were included in the study: therapy-related AML (t-AML), myelodysplastic syndrome AML (MDS AML) and chronic myelomonocytic leukemia AML (CMML AML) with documented history of MDS or CMML prior to transformation to AML, and *de novo* AML with karyotype changes characteristic of myelodysplasia (per 2008 WHO criteria).

The study included 2 phases, 1) Treatment Phase during which patients received up to 2 induction and 2 consolidation courses, and 2) a Follow-up Phase, which began 30 days after the last induction or consolidation course and continued for up to 5 years from randomization. The number of inductions and consolidations a patient received depended upon Complete Response (CR) or Complete Response with incomplete recovery (CRi), which was confirmed by bone marrow assessment. In Study 301, VYXEOS (daunorubicin 44 mg/m² and cytarabine 100 mg/m²) was administered intravenously over 90 minutes on days 1, 3 and 5 for the first induction and on days 1 and 3 for patients requiring a second induction. Patients could receive up to 2 cycles of induction and 2 cycles of consolidation in each arm. A second induction was highly recommended for patients who did not achieve a CR or CRi in the first induction course and was mandatory for patients achieving greater than 50% reduction in percent blasts. Post-remission therapy with hematopoietic stem cell transplantation (HSCT) was permitted either in

place of or after consolidation chemotherapy. For consolidation courses, in Study 301, the VYXEOS dose was reduced to daunorubicin 29 mg/m² and cytarabine 65 mg/m² on days 1 and 3. In the 7+3 arm, first induction consisted of cytarabine 100 mg/m²/day on days 1 to 7 by continuous infusion, and daunorubicin 60 mg/m²/day on days 1, 2 and 3, whereas second induction and consolidation cytarabine 100 mg/m² was administered on days 1 to 5 and daunorubicin on days 1 and 2.

There were 153 patients randomized to VYXEOS and 156 patients randomized to the 7+3 control arm. The patients were randomized (1:1) and stratified by age and AML sub-type to receive VYXEOS or 7+3 for induction and consolidation. The randomized patients had a median age of 68 (range, 60-75 years), 61% were male and 88% had an ECOG performance status of 0-1. At baseline 20% had t-AML, 54% had AML with an antecedent hematological disorder and 25% had *de novo* AML with myelodysplasia-related cytogenetic abnormalities; 34% had been treated previously with a hypomethylating agent for MDS; 54% had an adverse karyotype.

The demographic and baseline disease characteristics were generally balanced between the study arms. FLT3 mutation was identified in 15% (43/279) of patients tested and NPM1 mutation was identified in 9% (25/283) patients tested.

14.2 Study Results

The efficacy of VYXEOS in the treatment of newly diagnosed AML was evaluated in a Phase 3 (Study 301) controlled study.

Study 301 in Patients with Newly Diagnosed t-AML or AML-MRC

The primary endpoint was overall survival measured from the date of randomization to death from any cause. VYXEOS demonstrated superiority in overall survival in the ITT population compared with the comparator 7+3 treatment regimen (Figure 1). All patients on the VYXEOS arm and 97% of those on the control arm received at least 1 cycle of induction, and 32% on the VYXEOS arm and 21% on the control arm received at least 1 cycle of consolidation. The median survival for the VYXEOS treatment group was 9.56 months compared with 5.95 months for the 7+3 treatment group (Hazard Ratio = 0.69, 95% CI = 0.52, 0.90, two-sided log-rank test p = 0.005). The overall rate of HSCT was 34% (52/153) in the VYXEOS arm and 25% (39/156) on the control arm.

Table 11: Efficacy Results of Study 301

	VYXEOS N=153	7+3 N=156
Overall survival		
Median survival, months (95% CI)	9.56 (6.60, 11.86)	5.95 (4.99, 7.75)
Hazard ratio (95% CI)	0.69 (0.52, 0.90)	
p-value (2-sided) ^a	0.005	
Event-free survival		
Median survival, months (95% CI)	2.53 (2.07, 4.99)	1.31 (1.08, 1.64)
Hazard ratio (95% CI)	0.74 (0.58, 0.96)	

	VYXEOS N=153	7+3 N=156
p-value (2-sided) ^a	0.021	
Complete response rate		
CR, n (%)	57 (37)	40 (26)
Odds ratio (95% CI)	1.69 (1.03, 2.78)	
p-value (2-sided) ^b	0.040	
CR + CRi, n (%)	73 (48)	52 (33)
Odds ratio (95% CI)	1.77 (1.11, 2.81)	
p-value (2-sided) ^b	0.016	

Abbreviations: CI = Confidence interval; CR= Complete response; CRi= Complete response with incomplete recovery

^a p-value from stratified log rank test stratifying by age and AML sub-type

^b p-value from stratified Cochran-Mantel-Haenszel test stratified by age and AML sub-type

Figure 1: Kaplan-Meier Curve for Overall Survival, ITT Population, Study 301

60 Month Follow-up

The 60-month overall survival rate was higher for the VYXEOS treatment arm (18%) versus the 7+3 treatment arm (8%); the hazard ratio was 0.70 (95% CI: [0.55, 0.91]).

Overall, 53 of 153 (35%) patients treated with VYXEOS and 39 of 151 (25%) patients treated with 7+3 received an HSCT. At the 60-months follow-up, the median post-transplant survival had not been reached in the VYXEOS treatment arm at the time of the analysis, compared to a median post-transplant survival of 10.25 months in the 7+3 treatment arm (HR = 0.51; 95% CI: 0.28, 0.90).

15 MICROBIOLOGY

No microbiological information is required for this drug product.

16 NON-CLINICAL TOXICOLOGY

General Toxicology:

VYXEOS administered to rats via intravenous infusion as two cycles of three doses (5, 10, or 15/10 units/kg [13.2:30, 26.4:60, or 39.6/26.4:90/60 mg/m² daunorubicin:cytarabine, corresponding to 0.3, 0.6 and 0.9/0.6-fold the recommended human dose (RHD)]) over a period of 28 days resulted in premature deaths and unscheduled sacrifices in the mid- and high dose groups. Hematopoietic changes included bone marrow and lymphoid tissues hypocellularity which correlated with pancellar decrease in blood cell counts resulting in tissue hemorrhage and bacterial deposits. Small and large intestinal necrosis was reported. The reversibility of these findings could not be evaluated.

VYXEOS administered to dogs via intravenous infusion as one cycle of three doses (1, 2, or 3 units/kg [8.8:20, 17.6:40, or 26.4:60 mg/m² daunorubicin:cytarabine, corresponding to 0.2, 0.4, 0.6 times the RHD]) over a period of 5 days resulted in deaths and/or pre-terminal sacrifices in the mid- and high-dose groups. Only low dose animals received a second cycle of VYXEOS. Bone marrow and lymphoid tissues hypocellularity, and small and large intestinal necrosis was observed in pre-terminal mid- and high-dose animals. In low-dose animals, a pancellar decrease in blood cell counts was observed but with no histopathological correlates. These findings were partially or completely reversible. No cardiovascular findings were observed.

Carcinogenicity:

Carcinogenicity studies have not been conducted with VYXEOS.

Studies with cytarabine were not identified. Published data with Ara-C, the active metabolite of cytarabine, did not provide evidence of carcinogenicity.

Published data with daunorubicin suggest possible tumourigenicity in rats after a single doses of 5 mg/kg or 10 mg/kg (0.68 to 1.4 times the RHD on an mg/m² basis). The IARC Working Group (IARC 2000) classified daunorubicin in Group 2B – Drugs which are possibly carcinogenic to humans.

Genotoxicity:

Mutagenicity studies have not been conducted with VYXEOS.

Cytarabine was mutagenic (bacterial assay) and clastogenic (chromosome aberrations and sister-chromatid exchanges (SCE) in human leukocytes) in vitro, and clastogenic in vivo (chromosome aberrations and SCE in rodent). Cytarabine also caused the transformation of hamster embryo cells and rat H43 cells in vitro and was clastogenic to meiotic cells.

Daunorubicin was mutagenic (bacterial assay, V79 hamster cell assay) and clastogenic (CCRF-CEM human lymphoblasts) in vitro, and clastogenic in vivo (SCE assay in mouse bone marrow).

Reproductive and Developmental Toxicology:

Reproductive toxicity studies have not been conducted with VYXEOS.

Cytarabine was embryotoxic in mice and teratogenic in mice and rats when administered during organogenesis. A single dose of cytarabine in rats, administered on day 14 of gestation, reduced prenatal and postnatal brain size and caused permanent impairment of learning ability. Cytarabine also caused sperm-head abnormalities in mice and impaired spermatogenesis in rats.

Daunorubicin was embryotoxic and caused fetal malformations when given during the period of organogenesis in rats. Daunorubicin caused testicular atrophy and total aplasia of spermatocytes in the seminiferous tubules in dogs.

PATIENT MEDICATION INFORMATION

READ THIS FOR SAFE AND EFFECTIVE USE OF YOUR MEDICINE

Pr **VYXEOS®**

Daunorubicin and cytarabine liposome for injection

Read this carefully before you start taking **VYXEOS**. This leaflet is a summary and will not tell you everything about this drug. Talk to your healthcare professional about your medical condition and treatment and ask if there is any new information about **VYXEOS**.

Serious Warnings and Precautions

VYXEOS has different dosing directions than daunorubicin hydrochloride injection, cytarabine injection, daunorubicin citrate liposome injection and cytarabine liposome injection. Your healthcare professional will make sure you are getting the right drug and dose before giving you VYXEOS. If you think you may have received a different drug than usual, talk with your healthcare professional.

What is VYXEOS used for?

VYXEOS is used to treat:

- adults with newly diagnosed acute myeloid leukemia (a cancer of the white blood cells).
VYXEOS is given when:
 - the leukemia is caused by previous treatments. This is known as therapy related acute myeloid leukemia.
 - there are certain changes in the bone marrow, which is the spongy tissue inside your bones. This is known as acute myeloid leukemia with “myelodysplasia-related changes”.

How does VYXEOS work?

VYXEOS is part of a group of medicines called “antineoplastics” used against cancer. It contains two medicinal ingredients: daunorubicin and cytarabine. These two medicinal ingredients are packaged in tiny particles known as liposomes. VYXEOS is believed to kill cancer cells by stopping them from growing and dividing. Packaging the medicinal ingredients in liposomes allows the drug to stay longer in the body. The liposomes packaging also helps the drug enter the body and kill the cancer cells.

What are the ingredients in VYXEOS?

Medicinal ingredients: daunorubicin, cytarabine

Non-medicinal ingredients: cholesterol, copper gluconate, distearoylphosphatidylcholine, distearoylphosphatidylglycerol, sucrose, triethanolamine

VYXEOS comes in the following dosage forms:

Powder; 44 mg of daunorubicin and 100 mg cytarabine encapsulated in liposomes

Do not use VYXEOS if:

- you are allergic to daunorubicin or cytarabine, or to any of the other ingredients of this drug. If you are not sure about this, talk to your healthcare professional before taking VYXEOS

To help avoid side effects and ensure proper use, talk to your healthcare professional before you take VYXEOS. Talk about any health conditions or problems you may have, including if you:

- Have ever had a heart problem or heart attack, radiation therapy for cancers in the chest, are currently taking cancer medicines that damage the heart, or you have previously taken “anthracycline” cancer medicines. If this applies to you, your doctor may check your heart before starting, and during treatment. Your healthcare professional may end your treatment with VYXEOS depending on the condition of your heart.
- Have any allergic reactions. Your doctor may pause or stop treatment or slow the rate of your drip (infusion), if any allergic reactions occurs.
- Have had problems with your kidneys or liver. Your doctor will monitor you during treatment.
- Have ever had a condition known as Wilson’s disease or other copper-related disorder, as VYXEOS contains an ingredient known as ‘copper gluconate’.
- Are to be given a vaccine. Taking VYXEOS while getting a vaccine may result in a serious or fatal infection.

Other warnings you should know about:

Treatment with VYXEOS can increase your risk of certain side effects, including:

- Tissue death (Tissue necrosis). Tissue death may occur in the surrounding tissue where VYXEOS is injected.
- Inflammation/swelling of the digestive tract and/or diarrhea. This may impact your ability to absorb any medicines you are taking orally (through the mouth).
- A large decrease in the production of blood cells and platelets by the bone marrow. Low amounts of platelets may result in serious or fatal bleeding problems. Your healthcare professional:
 - will perform blood tests before and during your treatment
 - may also give you medicines to help stop you from getting an infection
 - will check you for infections during your treatment

Pregnancy and breastfeeding:

If you are pregnant, able to get pregnant or think you are pregnant, there are specific risks you should discuss with your healthcare professional.

- Avoid becoming pregnant while you are taking VYXEOS. It may harm your unborn baby.
- If you are able to become pregnant, your healthcare professional will do a pregnancy test before you start treatment with VYXEOS. This test must show that you are not pregnant.
- Use effective birth control during treatment and for at least 6 months after your last dose of VYXEOS. Talk to your healthcare professional about birth control methods that may be right for you during this time.
- Tell your healthcare professional right away if you become pregnant or think you may be pregnant during treatment with VYXEOS.
- If you are breastfeeding or plan to breastfeed. It is not known if VYXEOS passes into your breast milk. Do not breastfeed during treatment with VYXEOS. Talk to your doctor about the best way to feed your baby during this time.

Male Patients

- During your treatment with VYXEOS, use a condom each time you have sex with a woman who is pregnant, may be pregnant or could get pregnant. Continue using condoms until 6 months after your last dose.
- If, during your treatment with VYXEOS, your sexual partner becomes pregnant or thinks she may be pregnant, tell your healthcare professional right away.

Male Patients - Fertility:

VYXEOS may affect your fertility. This means that it may be difficult for you to have a child. Talk to your healthcare professional if you have questions about this.

Monitoring and Tests:

VYXEOS may cause you to have higher levels of uric acid in your blood. Your healthcare professional will monitor your uric acid levels by performing blood tests during your treatment with VYXEOS.

Driving and using machines:

You may feel sleepy or dizzy after having VYXEOS. If this happens, do not drive or use any tools or machines.

Tell your healthcare professional about all the medicines you take, including any drugs, vitamins, minerals, natural supplements or alternative medicines.

The following may interact with VYXEOS:

- Cancer medicines that can affect your heart, such as doxorubicin.
- Medicines that can affect your liver.

How to take VYXEOS:

- VYXEOS will be given to you by a healthcare professional who is experienced in treating AML.
- VYXEOS has a different dosing directions than other daunorubicin and cytarabine injection drugs. **VYXEOS should not be switched with other daunorubicin and cytarabine drugs.**
- You may be given medicines to treat nausea and vomiting before you are given VYXEOS. You may also be given a medicine that will prevent an increase of uric acid levels.
- It will be infused into your vein. It will be infused over a period of 90 minutes.

VYXEOS should be handled and disposed of with special care as it is a cytotoxic agent.

Usual dose:

- Your doctor will calculate your dose of VYXEOS based on your weight and height.
- Your treatment will be given in “courses” or “cycles” of infusions. Each course is given as a separate set of infusion and can be given weeks apart.
- You will receive a first course of treatment and your doctor will decide if you will receive further courses of treatment. This will depend on how you respond to treatment and any side effects you may experience. Your doctor will assess how you respond to treatment after each course.
- The recommended dosing schedule is the following:
 - During your first course - you will have an infusion on days 1, 3 and 5.
 - On any further course (if needed) - you will have an infusion on days 1 and 3.

Overdose:

If you think you or the person you are caring for, have been given too much VYXEOS, contact a healthcare professional or hospital emergency department immediately, even if there are no symptoms.

Missed Dose:

If you miss an appointment to receive your dose of VYXEOS, contact your health professional as soon as possible.

What are possible side effects from using VYXEOS?

These are not all the possible side effects you may feel when taking VYXEOS. If you experience any side effects not listed here, contact your healthcare professional.

- Abdominal pain, stomach cramps, excessive gas, reflux
- Anxiety, confusion or reduced awareness
- Blurred or impaired vision
- Bruising or bleeding without injury
- Chills
- Constipation
- Cough
- Diarrhea
- Dizziness
- Dry eye, eye swelling, eye pain, red eyes or itchy eyes
- Fatigue
- Fever
- Hemorrhoids
- Headache
- Hearing problems
- Itching, red skin, rash
- Loss of appetite
- Muscle pain, joint pain, bone pain
- Nausea and vomiting
- Pain around injection site
- Pinpoint, round spots that appear on the skin
- Sleep problems
- Swelling, including of the arms and legs

Serious side effects and what to do about them			
Symptom / effect	Talk to your healthcare professional		Stop taking drug and get immediate medical help
	Only if severe	In all cases	
VERY COMMON Infections , including in the: <ul style="list-style-type: none"> • Lungs • Blood fever; chills; sore throat; cough; mouth ulcers.		✓	
Febrile neutropenia (low white blood cells): fever, often with other signs of infection		✓	
Non-conduction Cardiotoxicity (damage to the heart muscle): chest pain		✓	
Hemorrhage (bleeding): bruising; nosebleed; brain hemorrhage	✓		
Chest pain		✓	
Shortness of breath/difficulty breathing		✓	
Arrhythmia (abnormal heart rhythms): irregular or rapid heartbeat; palpitations (feeling of the heart pounding or racing); shortness of breath; chest pain		✓	
Mucositis (inflammation of the mouth, stomach or intestine): mouth ulcers; altered taste; loss of appetite; difficulty to eat or talk; red or swollen mouth and gums; pain in the abdomen (belly); constipation; diarrhea	✓		
Hypersensitivity (allergic reaction): redness of skin; rash; itching; swelling; fever		✓	
Kidney problems : often without symptoms; decreased urination; body swelling; abdominal or lower back pain; nausea; fatigue; loss of appetite		✓	

Serious side effects and what to do about them			
Symptom / effect	Talk to your healthcare professional		Stop taking drug and get immediate medical help
	Only if severe	In all cases	
Transfusion reactions: (present as adverse signs or symptoms during or within 24 hours of a blood transfusion) fever; chills; pruritus or urticaria	✓		
Pleural effusion (fluids around the lungs): shortness of breath; chest pain; fever; cough		✓	
Hypoxia (low oxygen in tissues): shortness of breath while resting or after physical activity; waking up out of breath; wheezing	✓		
Hypotension (low blood pressure): dizziness; light-headedness; blurred vision; weakness; fatigue; nausea (feeling sick); palpitations; headache; cold and/or pale skin	✓		
Hypertension (high blood pressure): generally without symptoms; headache; nosebleeds; shortness of breath	✓		
COMMON Thrombocytopenia (low platelets) which may lead to anemia : tiredness; weakness		✓	
RARE Pneumonitis (inflammation of the lungs): difficulty breathing; shortness of breath; dry cough; fatigue; loss of appetite		✓	

Serious side effects and what to do about them			
Symptom / effect	Talk to your healthcare professional		Stop taking drug and get immediate medical help
	Only if severe	In all cases	
Hypothyroidism (underactive/low thyroid): Weight gain; tiredness; hair loss; muscle weakness; feeling cold; dry skin; constipation; puffy face; heavier than normal or irregular menstrual periods; enlarged thyroid gland		✓	
Hallucinations: seeing or hearing things that are not there		✓	

If you have a troublesome symptom or side effect that is not listed here or becomes bad enough to interfere with your daily activities, talk to your healthcare professional.

Reporting Side Effects

You can report any suspected side effects associated with the use of health products to Health Canada by:

- Visiting the Web page on Adverse Reaction Reporting (<https://www.canada.ca/en/health-canada/services/drugs-health-products/medeffect-canada/adverse-reaction-reporting.html>) for information on how to report online, by mail or by fax; or
- Calling toll-free at 1-866-234-2345.

NOTE: Contact your health professional if you need information about how to manage your side effects. The Canada Vigilance Program does not provide medical advice.

Storage:

Store in a refrigerator, in its original packaging to protect from light, at a temperature between 2°C to 8°C. Keep in an upright position.

Do not use VYXEOS after the expiry date which is stated on the carton and label after EXP. The expiry date refers to the last day of that month.

Once reconstituted and diluted for use, the infusion storage should not exceed 4 hours at 2°C to 8°C. VYXEOS should not be used if the solution is cloudy or contains particles.

Keep out of reach and sight of children.

If you want more information about VYXEOS:

- Talk to your healthcare professional
- Find the full product monograph that is prepared for healthcare professionals and includes this Patient Medication Information by visiting the Health Canada website: (<https://www.canada.ca/en/health-canada/services/drugs-health-products/drug-products/drug-product-database.html>); the manufacturer's website www.jazzpharma.com, or by calling 1-800-520-5568.
