

Product Monograph
Including Patient Medication Information

Pr **ROZLYTREK®**

entrectinib capsules

Capsules, 100 mg and 200 mg, Oral

Antineoplastic agent

ROZLYTREK, indicated for:

- the treatment of adult patients with unresectable locally advanced or metastatic extracranial solid tumours, including brain metastases, that have a neurotrophic tyrosine receptor kinase (NTRK) gene fusion without a known acquired resistance mutation, and with no satisfactory treatment options

has been issued marketing authorization with conditions, pending the results of new information to verify its clinical benefit. Patients should be advised of the nature of the authorization. For further information for ROZLYTREK please refer to Health Canada's [Notice of Compliance with conditions - drug products](#) web site.

ROZLYTREK, indicated for:

- the treatment of patients with ROS1-positive, locally advanced or metastatic non-small cell lung cancer (NSCLC)

has been issued market authorization without conditions.

Hoffmann-La Roche Limited
7070 Mississauga Road
Mississauga, ON L5N 5M8

Date of Authorization:
2026-04-20

Submission Control No: 298606

ROZLYTREK® is a trademark of F. Hoffmann-La Roche AG, used under license

What is a Notice of Compliance with Conditions (NOC/c)?

A NOC/c is a form of market approval granted to a product on the basis of promising evidence of clinical effectiveness following review of the submission by Health Canada.

Products authorized under Health Canada's NOC/c policy are intended for the treatment, prevention or diagnosis of a serious, life-threatening or severely debilitating illness. They have demonstrated promising benefit, are of high quality and possess an acceptable safety profile based on a benefit/risk assessment. In addition, they either respond to a serious unmet medical need in Canada or have demonstrated a significant improvement in the benefit/risk profile over existing therapies. Health Canada has provided access to this product on the condition that sponsors carry out additional clinical trials to verify the anticipated benefit within an agreed upon time frame.

Patient Medication Information		38

Part 1: Healthcare Professional Information

1 Indications

NOC/c **NTRK gene fusion positive solid tumours:**
ROZLYTREK (entrectinib) is indicated for the treatment of adult patients with unresectable locally advanced or metastatic extracranial solid tumours, including brain metastases, that have a neurotrophic tyrosine receptor kinase (*NTRK*) gene fusion without a known acquired resistance mutation, and with no satisfactory treatment options.

Clinical effectiveness is based on tumour objective response rate (ORR) and duration of response (DOR) in an integrated analysis of efficacy data from three studies in adults (see [14 Clinical Trials](#)).

Prior to initiation of ROZLYTREK therapy, *NTRK* fusion-positive status should be established using a validated test.

ROZLYTREK should only be administered under the supervision of a health professional experienced in the use of antineoplastic agents.

ROS1 Positive Non-Small Cell Lung Cancer (NSCLC):

ROZLYTREK (entrectinib) is indicated for the treatment of patients with *ROS1*-positive locally advanced or metastatic non-small cell lung cancer (NSCLC) not previously treated with crizotinib.

1.1 Pediatrics

Pediatrics (<18 years of age):

NTRK gene fusion positive solid tumours:

Based on the limited data submitted and reviewed by Health Canada, the safety of ROZLYTREK in pediatric patients has not been established; therefore, Health Canada has not authorized an indication for pediatric use (see [7 Warnings and Precautions](#), Musculoskeletal, Skeletal Fractures).

ROS1 Positive Non-Small Cell Lung Cancer (NSCLC):

No pediatric data are available to Health Canada for *ROS1*-positive, locally advanced or metastatic NSCLC; therefore, Health Canada has not authorized an indication for pediatric use.

1.2 Geriatrics

Geriatrics (≥ 65 years of age): No differences in safety or efficacy were observed between patients ≥ 65 years of age and younger patients.

2 Contraindications

ROZLYTREK is contraindicated in patients who are hypersensitive to this drug or to any ingredient in the formulation, including any non-medicinal ingredient, or component of the container. For a complete listing, see [6 Dosage Forms, Strengths, Composition, and Packaging](#).

3 Serious Warnings and Precautions Box

Serious Warnings and Precautions

- ROZLYTREK may cause fetal harm when administered to a pregnant woman ([7.1.1 Pregnant Women](#))
- ROZLYTREK may cause congestive heart failure (see [7 Warnings and Precautions](#), Cardiovascular, Congestive Heart Failure)

4 Dosage and Administration

4.1 Dosing Considerations

NOC/c

- A validated assay is required for the selection of patients with *NTRK* fusion-positive unresectable locally advanced or metastatic extracranial solid tumours, including brain metastases. *NTRK* fusion-positive status should be established prior to initiation of ROZLYTREK therapy.
- A validated assay is required for the selection of patients with ROS1-positive locally advanced or metastatic NSCLC. ROS1-positive status should be established prior to initiation of ROZLYTREK therapy.

4.2 Recommended Dose and Dosage Adjustment

Dosage

ROZLYTREK hard capsules can be taken with or without food, swallowed whole, and must not be opened or dissolved.

The recommended dose of ROZLYTREK is 600 mg given orally, once daily (see [10.3 Pharmacokinetics](#)).

Health Canada has not authorized an indication for pediatric use for ROS1-positive, locally advanced or metastatic NSCLC.

Duration of Treatment

It is recommended that patients are treated with ROZLYTREK until disease progression or unacceptable toxicity.

Dose Modifications

Management of adverse events may require temporary interruption, dose reduction, or discontinuation of treatment with ROZLYTREK, based on the prescriber's assessment of the patient's safety or tolerability.

The dose of ROZLYTREK may be reduced up to 2 times, based on tolerability. Table 1 provides general dose reduction advice for adult patients. ROZLYTREK treatment should be permanently discontinued if patients are unable to tolerate a dose of 200 mg once daily.

Table 1 Dose Reduction Schedule

Dose Reduction Schedule	Dose Level
Starting Dose	600 mg once daily
First dose reduction	400 mg once daily
Second dose reduction	200 mg once daily

Dose Modifications for Specific Adverse Reactions

Recommendations for ROZLYTREK dose modifications for specific adverse reactions are provided in Table 2 (see [7 Warnings and Precautions](#) and [8 Adverse Reactions](#)).

Table 2 Recommended Dose Modifications for Specified Adverse Drug Reactions

Adverse Drug Reaction	Severity *	Dose Modification
Anemia or Neutropenia	Grade 3 or Grade 4	Withhold ROZLYTREK until recovery to $\leq$ Grade 2 or to baseline, then resume treatment at same dose level or reduced dose by 1 level, as clinically needed.
Central Nervous System Effects	Grade $\geq$ 2	Withhold ROZLYTREK until recovery to $\leq$ Grade 1 or to baseline, then resume treatment at reduced dose by 1 level. If event recurs, further reduce dose by 1 level. For prolonged, severe, or intolerable events, discontinue as clinically appropriate.
Hepatotoxicity	Grade 3	Withhold ROZLYTREK until recovery to less than or equal to Grade 1 or to baseline. Resume at same dose if resolution occurs within 4 weeks. Permanently discontinue if adverse reaction does not resolve within 4 weeks. Resume at a reduced dose for recurrent Grade 3 events that resolve within 4 weeks.
	Grade 4	Withhold ROZLYTREK until recovery to less than or equal to Grade 1 or to baseline. Resume at reduced dose if resolution occurs within 4 weeks. Permanently discontinue if adverse reaction does not resolve within 4 weeks. Permanently discontinue for recurrent Grade 4 events.
	ALT or AST greater than 3 times ULN with concurrent total bilirubin greater than 1.5 times ULN (in the absence of	Permanently discontinue ROZLYTREK.

Adverse Drug Reaction	Severity *	Dose Modification
	cholestasis or hemolysis)	
Hyperuricemia	Symptomatic or Grade 4	Initiate urate-lowering medication. Withhold ROZLYTREK until improvement of signs or symptoms. Resume ROZLYTREK at same or reduced dose.
Syncope	Any Grade	Withhold ROZLYTREK until recovered, then resume treatment at reduced dose by 1 level. If event recurs, further reduce dose by 1 level or consider discontinuation as clinically appropriate.
Congestive Heart Failure	Grade 2 or 3	Withhold ROZLYTREK until recovered to ≤ Grade 1. Resume at reduced dose.
	Grade 4	Permanently discontinue ROZLYTREK
QT Interval Prolongation	QTc 481 to 500 ms	Withhold ROZLYTREK until recovered to baseline, then resume treatment at same dose.
	QTc greater than 500 ms	Withhold ROZLYTREK until QTc interval recovers to baseline, then resume at same dose if factors that cause QT prolongation are identified and corrected. Resume at reduced dose if other factors that cause QT prolongation are not identified.
	Torsade de pointes; polymorphic ventricular tachycardia; signs/symptoms of serious arrhythmia	Permanently discontinue ROZLYTREK.
Vision Disorders	Grade 2 or above	Withhold ROZLYTREK until improvement or stabilization. Resume at same dose or reduced dose, as clinically appropriate.
Other clinically relevant adverse reactions	Grade 3 or 4	Withhold ROZLYTREK until adverse reaction resolves or improvement to Grade 1 or baseline. Resume at same or reduced dose, if resolution occurs within 4 weeks. Consider permanent discontinuation if adverse reaction does not resolve within 4 weeks. Permanently discontinue for recurrent Grade 4 events.

*Severity as defined by National Cancer Institute Common Terminology Criteria for Adverse Events (NCI CTCAE)

Dose Modifications for Concomitant strong or moderate CYP3A inhibitors

The concomitant use of strong or moderate CYP3A inhibitors and ROZLYTREK in adults should be avoided or limited to 14 days or less. If concomitant use of strong or moderate CYP3A inhibitors cannot be avoided, ROZLYTREK dose should be reduced to 100 mg once daily for

use with strong CYP3A inhibitors and to 200 mg once daily for use with moderate CYP3A inhibitors.

After discontinuation of the concomitant strong or moderate CYP3A inhibitors, ROZLYTREK dose that was taken prior to initiating the strong or moderate CYP3A inhibitor can be resumed. A wash out period may be required for CYP3A4 inhibitors with long half-life (see [9 Drug Interactions](#)).

Dose Modifications for Concomitant CYP3A inducers

Co-administration of ROZLYTREK with CYP3A inducers should be avoided (see [9 Drug Interactions](#)).

Dose Modifications for Special Populations

Pediatric use

Health Canada has not authorized an indication for ROZLYTREK for pediatric use.

Geriatric use

No dose adjustment of ROZLYTREK is required in patients ≥ 65 years of age (see [10.3 Pharmacokinetics](#), Special Populations and Conditions).

Renal Impairment

No dose adjustment is required in patients with mild or moderate renal impairment $\text{CrCl} \geq 30$ mL/min calculated by the Cockcroft-Gault equation). ROZLYTREK has not been studied in patients with severe renal impairment $\text{CrCl} < 30$ mL/min).

Hepatic Impairment

No dose adjustment is required in patients with underlying mild (Child-Pugh A), moderate (Child-Pugh B) or severe (Child-Pugh C) hepatic impairment based on a study in subjects with hepatic impairment (see [10.3 Pharmacokinetics](#), Special Populations and Conditions). Patients with severe hepatic impairment should be carefully monitored for hepatic function and adverse reactions.

Ethnicity

No dose adjustment is necessary for patients of different ethnicities (see [10.3 Pharmacokinetics](#), Special Populations and Conditions).

4.4 Administration

The recommended dose should be administered orally and can be taken with or without food, swallowed whole, and must not be opened or dissolved.

4.5 Missed Dose

If a planned dose of ROZLYTREK is missed, patients can make up that dose unless the next dose is due within 12 hours. If vomiting occurs immediately after taking a dose of ROZLYTREK, patients may repeat that dose.

5 Overdose

There is no experience with overdose in clinical trials with ROZLYTREK. Patients who experience overdose should be closely supervised and supportive care instituted. There are no known antidotes for ROZLYTREK.

For the most recent information in the management of a suspected drug overdose, contact your regional poison control centre or Health Canada's toll-free number, 1-844 POISON-X (1-844-764-7669).

6 Dosage Forms, Strengths, Composition, and Packaging

Table 3 Dosage Forms, Strengths, and Composition

Route of Administration	Dosage Form / Strength/ Composition	Non-medicinal Ingredients
Oral	Capsule, 100 mg and 200 mg	Colloidal silicon dioxide, crospovidone, hypromellose, lactose anhydrous, magnesium stearate, microcrystalline cellulose, and tartaric acid. The 100 mg capsule shell contains hypromellose, titanium dioxide, and yellow iron oxide. The 200 mg capsule shell contains FD&C yellow #6, hypromellose, and titanium dioxide. The printing ink contains FD&C blue #2 aluminum lake, propylene glycol, shellac, and strong ammonia solution.

ROZLYTREK capsules are supplied as follows:

- 100 mg – bottle containing 30 yellow opaque hard-shell capsules with “ENT 100” printed in blue ink
- 200 mg – bottle containing 90 orange opaque hard-shell capsules with “ENT 200” printed in blue ink

7 Warnings and Precautions

Cardiovascular

Congestive Heart Failure

Congestive heart failure (CHF) has been reported across clinical trials with ROZLYTREK (see Table 4 in [8 Adverse Reactions](#)). These reactions were observed in patients with or without a history of cardiac disease and resolved in some patients upon treatment with diuretics and/or dose reduction/interruption of ROZLYTREK. Clinical trials excluded patients with symptomatic CHF, myocardial infarction, unstable angina, or coronary artery bypass graft within three to six months of study entry.

Assess left ventricular ejection fraction (LVEF) prior to initiation of ROZLYTREK in patients with symptoms or known risk factors for CHF. Patients receiving ROZLYTREK should be carefully monitored and those with clinical signs and symptoms of CHF, including shortness of breath or edema, should be evaluated and treated as clinically appropriate. For patients with new onset or

worsening CHF, withhold ROZLYTREK, institute appropriate medical management and reassess LVEF.

Based on the severity of CHF or worsening LVEF, resume ROZLYTREK treatment at a reduced dose upon recovery to baseline or permanently discontinue ROZLYTREK (see Table 2 in [4 Dosage and Administration](#)).

QTc Interval Prolongation

QT interval prolongation has been observed in patients treated with ROZLYTREK in clinical trials (see [8 Adverse Reactions](#)). Across the clinical trials, 10/355 (2.8%) patients with at least one post-baseline ECG assessment experienced a QTc interval increase over baseline of greater than 60 ms and 6/355 (1.7%) patients had a QTc interval >500 ms. In non-clinical studies, ROZLYTREK caused QT/QTc interval prolongation and had an inhibitory effect on hERG tail currents (See [16 Non-Clinical Toxicology](#), Safety Pharmacology).

Use of ROZLYTREK should be avoided in patients with congenital long QT syndrome and in patients taking medications that are known to prolong QT interval. Assessment of ECG at baseline and periodic monitoring of ECGs and electrolytes are recommended, adjusting frequency based on risk factors such as congestive heart failure, electrolyte abnormalities, or concomitant medications known to prolong QT interval.

Based on the severity of QTc prolongation, withhold ROZLYTREK treatment and then resume at same or reduced dose, or permanently discontinue (see Table 2 in [4 Dosage and Administration](#)).

Driving and Operating Machinery

ROZLYTREK may influence the ability to drive and use machines. If patients experience cognitive adverse reactions, syncope, blurred vision, or dizziness during treatment with ROZLYTREK, patients should be instructed not to drive or operate machines until the symptoms resolve.

Embryo-Fetal Toxicity

Based on the findings in animal studies, ROZLYTREK may cause fetal harm when administered to a pregnant woman. When administered to pregnant rats, ROZLYTREK caused maternal toxicity and fetal malformations at exposures 2.7 -fold the human exposure by AUC at the recommended dose (see [16 Non-Clinical Toxicology](#)).

Female patients receiving ROZLYTREK should be advised of the potential harm to the fetus. Female patients of reproductive potential, must use highly effective contraceptive methods during treatment and for 5 weeks following the last dose of ROZLYTREK (see [7.1 Special Populations](#)).

Endocrine and Metabolism

Hyperuricemia

Amongst the 355 patients who received ROZLYTREK across clinical trials, 9% of patients experienced hyperuricemia as an adverse event. Grade 4 events were reported in 1.7% of patients, including one patient who died of tumour lysis syndrome. In all 32 patients with an event of hyperuricemia, 6% required dose reduction, 6% required dose interruption and 34% required interventions to reduce uric acid levels (urate lowering drugs).

Assess serum uric acid levels prior to initiating ROZLYTREK and periodically during treatment.

Monitor for signs and symptoms of hyperuricemia. Initiate treatment with urate-lowering medications as clinically indicated, and withhold ROZLYTREK treatment for signs and symptoms of hyperuricemia. Based on the severity of hyperuricemia resume ROZLYTREK at same or reduced dose upon improvement in signs and symptoms (see Table 2 in [4 Dosage and Administration](#)).

Hepatic/Biliary/Pancreatic

Amongst the 355 patients who received ROZLYTREK across clinical trials, increases in AST of any grade occurred in 44% of patients and increases in ALT of any grade occurred in 38% of patients. Grade 3-4 increases in AST and ALT occurred in 2.7% and 2.9% of patients respectively. Increases in AST or ALT leading to dose reductions or interruption occurred in 0.8% and 0.8% of patients respectively. The median time to onset of increased AST and ALT was 2 weeks.

Monitor liver function tests, including ALT and AST, every 2 weeks during the first month of treatment, then monthly thereafter, and as clinically indicated. Based on the severity of hepatotoxicity, withhold ROZLYTREK treatment and resume at same or reduced dose, or permanently discontinue (see Table 2 in [4 Dosage and Administration](#)).

Musculoskeletal

Skeletal Fractures

ROZLYTREK increases the risk of fractures. In an expanded safety population review, 5% of adult patients and 23% of pediatric patients experienced fractures. In adult patients, some fractures occurred in the setting of a fall or other trauma to the affected area, while in the pediatric patients, all fractures occurred in patients with minimal or no trauma. In both adults and pediatric patients, most fractures were hip or other lower extremity fractures (e.g., femoral or tibial shaft). The median time to fracture was 3.8 months in adults and 4.0 months in pediatric patients. ROZLYTREK treatment was interrupted in 41% of adults and 43% of pediatric patients due to fractures.

There are no data on the effects of ROZLYTREK on healing fractures or on the risk of future fractures.

Patients with signs and symptoms of fractures should be promptly evaluated. ROZLYTREK is not recommended for use in pediatric patients under the age of 18; Health Canada has not authorized an indication for pediatric use.

Neurologic

Central Nervous System Effects

Cognitive disorders, including confusion, mental status changes, memory impairment, and hallucinations, were reported in clinical trials with ROZLYTREK (see [8 Adverse Reactions](#) for description of events).

Additionally, a broad spectrum of other central nervous system (CNS) adverse reactions were reported. Amongst the 355 patients receiving entrectinib across clinical trials, 10% experienced mood disorders (depression, anxiety and agitation), 38% experienced dizziness, and 14% experienced sleep disturbances (predominantly insomnia).

The incidence of CNS adverse reactions was similar in patients with or without CNS metastases; however, the incidence of dizziness (38% vs 31%), headache (21% vs 13%), paresthesia (20% vs 6%), balance disorder (13% vs 4%), and confusional state (11% vs 2%)

appeared to be increased in patients with CNS metastases who had received prior CNS irradiation (N = 90) compared to those who did not (N = 48).

Patients should be monitored for signs of cognitive changes or other CNS events. Based on the severity, ROZLYTREK treatment should be withheld or permanently discontinued (see Table 2 in [4 Dosage and Administration](#)).

Patients should be counseled on the potential for cognitive changes with ROZLYTREK treatment. If patients experience cognitive changes, they should be instructed not to drive or operate machines until symptoms resolve.

Syncope

Syncope events were reported across clinical trials with ROZLYTREK (see [8 Adverse Reactions](#)). In some patients, syncope was reported with concurrent hypotension, dehydration, or QT prolongation and in other patients no other concurrent related conditions were reported. Patients experiencing syncope should be evaluated and ROZLYTREK treatment should be withheld until recovered, then resumed at reduced dose (see Table 2 in [4 Dosage and Administration](#)).

Ophthalmologic

Among the 355 patients who received ROZLYTREK across clinical trials, vision changes occurred in 21% of patients, including Grade 1 (82%), Grade 2 (14%) and Grade 3 (4.1%) (see [8 Adverse Reactions](#)). Vision disorders occurring in $\geq 1\%$ included blurred vision (8.7%), photophobia (5.1%), diplopia (3.1%), visual impairment (2%), photopsia (1.1%), cataract (1.1%), and vitreous floaters (1.1%).

Visual disorders have been reported with Anaplastic Lymphoma Kinase (*ALK*) receptor tyrosine kinase inhibitors and entrectinib is reported to inhibit the *ALK* receptor tyrosine kinase.

Patients should be counseled on the potential for visual changes with ROZLYTREK treatment. If patients experience symptoms of vision disorders, they should be instructed not to drive or use machines until symptoms resolve.

For patients with new visual changes, consider an ophthalmological evaluation. Based on the severity of visual changes, withhold ROZLYTREK or modify treatment dosage (see Table 2 in [4 Dosage and Administration](#)).

Reproductive Health: Female and Male Potential

Pregnancy testing

Women of childbearing potential should not become pregnant while on treatment and should not be pregnant at the beginning of treatment. Female patients of reproductive potential should have medically supervised pregnancy testing prior to initiating ROZLYTREK therapy.

Contraception

Female patients of reproductive potential, must use highly effective contraceptive methods during treatment and for 5 weeks following the last dose of ROZLYTREK (see [16 Non-Clinical Toxicology](#)).

Based on the potential for genotoxicity and risk of teratogenicity, male patients with female partners of child-bearing potential must use highly effective contraceptive methods during

treatment and for 3 months following the last dose of ROZLYTREK (see [16 Non-Clinical Toxicology](#)).

Fertility

Dedicated fertility studies were not conducted with entrectinib. Dose-dependent reductions in prostate weight were observed in male dogs (See [16 Non-Clinical Toxicology](#)).

7.1 Special Populations

7.1.1 Pregnancy

Female patients of reproductive potential must be advised to avoid pregnancy while receiving ROZLYTREK (see [7 Warnings and Precautions](#)). There is no available data on the use of ROZLYTREK in pregnant women. Based on animal studies with entrectinib (see [16 Non-Clinical Toxicology](#)) and its mechanism of action, ROZLYTREK may cause fetal harm when administered to a pregnant woman. Patients receiving ROZLYTREK should be advised of the potential harm to the fetus. Female patients should be advised to contact their healthcare professional, should pregnancy occur.

7.1.2 Breastfeeding

It is not known whether entrectinib or its metabolites are excreted in human breast milk. No studies have been conducted to assess the effects of ROZLYTREK on milk production or its presence in breast milk. As the potential for harm to the nursing infant is unknown, mothers should be advised to discontinue breast-feeding during treatment with ROZLYTREK and for 14 days after the final dose.

7.1.3 Pediatrics

Based on limited data submitted and reviewed by Health Canada, the safety of ROZLYTREK in pediatric patients has not been established; therefore, Health Canada has not authorized an indication for pediatric use.

ROZLYTREK has been studied in children, adolescents, and young adults. ROZLYTREK was associated with a higher risk of skeletal fractures in the pediatric population compared to adults (see Musculoskeletal section above). Population pharmacokinetic data demonstrate similar drug exposure in adults and pediatric patients (see [10.3 Pharmacokinetics](#), Special Populations and Conditions).

7.1.4 Geriatrics

No differences in safety or efficacy were observed between patients ≥ 65 years of age and younger patients.

8 Adverse Reactions

8.1 Adverse Reaction Overview

For the clinical development program of ROZLYTREK, a total of 355 patients, including 16 pediatric and young adult patients, have received ROZLYTREK in four clinical trials (ALKA, STARTRK-1, STARTRK-2, and STARTRK-NG). The safety of ROZLYTREK was evaluated as integrated analyses of these four ongoing clinical trials. The median duration of exposure to

ROZLYTREK was 5.5 months.

In this safety population, the most common tumours were lung (56%), sarcoma (8%), and colon (5%). *ROS1* gene fusions were present in 42% and *NTRK* gene fusions were present in 20%. Most patients (75%) received ROZLYTREK 600 mg orally once daily. The doses ranged from 100 mg/m² to 1600 mg/m² once daily in adults and 250mg/m² to 750 mg/m² once daily in pediatric patients. Health Canada has not authorized an indication for pediatric use.

Grade 3-4 adverse reactions occurred in 60% of patients; the most common (≥2%) were lung infection (5%), increased weight (7%), dyspnea (6%), fatigue/asthenia (5%), cognitive disorders (4.5%), syncope (2.5%), pulmonary emboli (3.4%), hypoxia (3.4%), pleural effusion (3.1%), hypotension (2.8%), diarrhea (2%), and urinary tract infection (2.5%).

Fatal events included dyspnea (0.6%), pneumonia (0.6%), sepsis (0.6%), completed suicide (0.3%), large intestine perforation (0.3%), and tumour lysis syndrome (0.3%).

Permanent discontinuation due to an adverse reaction occurred in 9% of patients who received ROZLYTREK. The most frequent adverse reaction (<1% each) that resulted in permanent discontinuation were pneumonia, cardio-respiratory arrest, dyspnea, and fatigue.

8.2 Clinical Trial Adverse Reactions

Because clinical trials are conducted under very specific conditions, the adverse reaction rates observed in the clinical trials may not reflect the rates observed in practice and should not be compared to the rates in the clinical trials of another drug. Adverse reaction information from clinical trials is useful for identifying drug-related adverse events and for approximating rates.

Table 4 summarizes the adverse drug reactions (ADRs) occurring in patients treated with ROZLYTREK. Adverse drug reactions from clinical trials are listed by MedDRA system organ class.

Table 4 Summary of Adverse Drug Reactions (>10% for All Grades) Occurring in Patients Treated with ROZLYTREK in Clinical Trials (Integrated Safety Population)

	All Grades n (%)	Grade 3 – 4 n (%)

ALT: Alanine aminotransferase

AST: Aspartate aminotransferase

¹ Includes the preferred terms: cognitive disorder, confusional state, disturbance in attention, memory impairment, amnesia, mental status changes, hallucination, delirium, 'hallucination visual', and mental disorder.

² Includes the preferred terms: neuralgia, neuropathy peripheral, peripheral motor neuropathy, peripheral sensory neuropathy

³ Includes the preferred terms: paresthesia, hyperesthesia, hypoesthesia, dysesthesia

⁴ Includes the preferred terms: ataxia, balance disorder, gait disturbances

⁵ Includes the preferred terms: dizziness, vertigo, dizziness postural

⁶ Includes the preferred terms: face edema, fluid retention, generalized edema, localized edema, edema, edema peripheral, peripheral swelling

⁷ Includes the preferred terms: back pain, neck pain, musculoskeletal chest pain, musculoskeletal pain, pain in extremity

⁸ Includes the preferred terms: bronchitis, lower respiratory tract infection, lung infection, pneumonia, respiratory tract infection, upper respiratory tract infection

⁹ Includes the preferred terms: neutropenia, neutrophil count decreased

¹⁰ Includes the preferred terms: rash, rash maculopapular, rash pruritic, rash erythematous, rash papular

¹¹ Includes the preferred terms: blindness, cataract, cortical cataract, corneal erosion, diplopia, eye disorder, photophobia, photopsia, retinal hemorrhage, vision blurred, visual impairment, vitreous adhesions, vitreous detachment, vitreous floaters

¹² Includes the preferred terms: fatigue, asthenia

¹³ Includes the preferred terms: hypotension, orthostatic hypotension

¹⁴ Includes the preferred terms: insomnia, somnolence, hypersomnia, sleep disorder

¹⁵ Includes the preferred terms: anxiety, affect lability, affective disorder, agitation, depressed mood, euphoric mood, mood altered, mood swings, irritability, depression, persistent depressive disorder, psychomotor retardation

8.3 Less Common Clinical Trial Adverse Reactions

Adverse drug reactions occurring in less than 10% of patients include:

Cardiac Disorders: congestive heart failure* (3.4%), and electrocardiogram QT prolongation (2.0%)

*Includes the preferred terms: acute right ventricular failure, cardiac failure, cardiac failure congestive, chronic right ventricular failure, ejection fraction decreased, pulmonary edema.

Gastrointestinal Disorders: dysphagia (9.9%)

Metabolism and Nutrition Disorders: Hyperuricemia (9.0%)

Musculoskeletal Disorders: bone fractures* (5% in adults; 23% in the pediatric population)

*Includes the preferred terms: humerus fracture, foot fracture, ankle fracture, femoral neck fracture, stress fracture, fibula fracture, fracture, rib fracture, spinal fracture, wrist fracture, femur fracture, pathological fracture.

Nervous System Disorders: syncope (3.9%); cognitive disorders

Cognitive Disorders

A variety of cognitive symptoms were reported across clinical trials. These included events reported as cognitive disorders (7.9%), confusional state (7.3%), disturbance in attention (4.8%), memory impairment (3.7%), amnesia (2.5%), mental status changes (1.7%), hallucination (1.1%), delirium (0.8%), hallucination visual (0.3%), and mental disorder (0.3%). Grade 3 events were reported in 4.5% of patients. In the pediatric population, 6.3% (1/16) pediatric patients experienced disturbance in attention of Grade 1 severity. Patients who had brain metastases at baseline had a higher frequency of these events (39%) compared to those without brain metastases (24.9%).

Renal and urinary disorders: urinary retention (5.1%)

8.4 Abnormal Laboratory Findings: Hematologic, Clinical Chemistry and Other Quantitative Data

The following table provides treatment-emergent shifts from baseline in laboratory abnormalities occurring in patients treated with ROZLYTREK across the four clinical trials.

Table 5 Laboratory Abnormalities (≥ 20%) Worsening from Baseline in Patients Treated with ROZLYTREK in Clinical Trials (Integrated Safety Population)

Laboratory Abnormality	ROZLYTREK NCI CTCAE Grade	
	All Grades (%) ¹	Grade 3-4 (%) ¹

AST: Aspartate Aminotransferase; ALT: Alanine Aminotransferase

¹ Denominator for each laboratory parameter is based on the number of patients with a baseline and post-treatment laboratory value available which ranged from 111 to 346 patients.

² Based on NCI CTCAE v5.0

³ NE = Not evaluable. Grade 1 and 2 could not be determined per NCI CTCAE v5.0, as fasting glucose values were not collected.

8.5 Post-Market Adverse Reactions

Not Applicable.

9 Drug Interactions

9.3 Drug-Behaviour Interactions

ROZLYTREK may influence the ability to drive and operate machines (see [7 Warnings and Precautions](#)).

9.4 Drug-Drug Interactions

Table 6 Established or Potential Drug-Drug Interactions

Common name	Source of Evidence	Effect	Clinical comment
Drugs that may increase entrectinib plasma concentrations			
CYP3A inhibitors (Strong and moderate, including, but not limited to, ritonavir, saquinavir, telithromycin, ketoconazole, itraconazole, voriconazole, posaconazole)	CT	Co-administration of a single oral dose of entrectinib with multiple oral doses of itraconazole, a strong CYP3A4 inhibitor, increased systemic exposure of entrectinib by 500%. GMR with/without itraconazole for AUC _{inf} (90% CI) was 604% (454%, 804%) and C _{max} (90% CI) was 173% (137%, 218%).	Co-administration of strong and moderate CYP3A inhibitors with ROZLYTREK should be avoided or limited to 14 days. If concurrent use is unavoidable, dose adjustment of ROZLYTREK is required (see 4 Dosage and Administration).
Drugs that may decrease entrectinib plasma concentrations			
CYP3A inducers (including, but not limited to, carbamazepine, phenobarbital, phenytoin, rifabutin, rifampin)	CT	Co-administration of multiple oral doses of rifampin, a strong CYP3A inducer, with a single oral dose of entrectinib reduced systemic exposure of entrectinib by 77%. GMR with/without rifampin for AUC _{inf} (90% CI) was 23.3% (18.4%, 29.5%) and C _{max} (90% CI) was 44.4% (35.3%, 55.9%).	Co-administration of ROZLYTREK with CYP3A inducers should be avoided (see 4 Dosage and Administration).
Effect of entrectinib on CYP substrates			
CYP3A4 substrates (e.g., astemizole, cisapride, cyclosporin, ergotamine, fentanyl, pimozide, quinidine, tacrolimus, alfentanil and sirolimus),	CT	Co-administration of multiple doses of entrectinib and midazolam, a sensitive CYP3A substrate, increased systemic exposure of midazolam by approximately 50% indicating a weak inhibitory effect of entrectinib on the metabolism of midazolam (GMR with/without entrectinib for AUC _{inf} (90% CI) was 150% (129%, 173%)).	No dose adjustment is required when ROZLYTREK is co-administered with CYP3A substrates.

Common name	Source of Evidence	Effect	Clinical comment
Effect of entrectinib on transporters			
P-gp substrates (e.g. digoxin, topotecan, sirolimus, everolimus, nilotinib, lapatinib)	CT	Co-administration of a single oral dose of entrectinib with a sensitive P-gp substrate, digoxin, increased digoxin C_{max} by approximately 28% and overall exposure by approximately 18% (GMR with/without entrectinib for C_{max} (90% CI) was 128% (98.2%, 167%) and AUC_{inf} (90% CI) was 118% (106%, 132%)). The renal clearance of digoxin was similar between treatments of digoxin alone and digoxin co-administered with entrectinib, indicating minimal effect of entrectinib on renal clearance of digoxin. These results indicate that entrectinib is a weak P-gp inhibitor and that no clinically significant interaction exists between digoxin, as a P-gp substrate, and entrectinib.	No dose adjustment is required when ROZLYTREK is co-administered with P-gp substrates.
Gastric pH elevating medications			
Medicinal products that increase gastric pH (e.g. H2 receptor antagonists or antacids)	CT	Administration of entrectinib with lansoprazole (a proton pump inhibitor (PPI)), resulted in a 25% decrease in entrectinib systemic exposure which is not clinically relevant. GMR with/without lansoprazole for AUC_{inf} (90%CI) was 74.5% (64.7%, 85.9%) and C_{max} (90% CI) was 76.5% (67.6%, 86.6%).	No dose adjustments are required when ROZLYTREK is co-administered with PPIs or other drugs that raise gastric pH.

CT = Clinical Trial

Drugs that Prolong QT Interval

QTc interval prolongation has been reported in 2.8% of patients treated with ROZLYTREK. The concomitant administration of ROZLYTREK with other medicinal products known to prolong the QT interval or induce Torsade de Pointes should be avoided (see [7 Warnings and Precautions](#), Cardiovascular, QTc Interval Prolongation).

Effects of entrectinib on Other Drugs

CYP substrates

Based on the *in vitro* studies in human liver microsomes, entrectinib exhibits inhibitory potential toward CYP3A.

In vitro studies indicate that entrectinib and its major active metabolite, M5, do not inhibit CYP1A2, CYP2B6, CYP2C8, CYP2C9, CYP2C19, and CYP2D6.

BCRP substrates

As with P-gp, a mild inhibition of BCRP was observed in *in vitro* studies. Given that no clinically significant interaction was observed with the P-gp substrate digoxin, an interaction with BCRP is not predicted. No dose adjustment is required when ROZLYTREK is co-administered with BCRP substrates.

Other transporter substrates

In vitro data indicate that entrectinib has weak inhibitory potential toward organic anion-transporting polypeptide (OATP) 1B1 and multidrug and toxin extrusion protein 1 (MATE1).

Oral Contraceptive

Physiologically-based pharmacokinetic simulation of the effects of co-administration of multiple oral doses of entrectinib with ethinyl estradiol, an oral contraceptive, predicted no drug-drug interaction. GMR with/without entrectinib for AUC_{inf} (90% CI) of 112% (111%, 113%) and C_{max} (90% CI) was 112% (111%, 113%).

Therefore ROZLYTREK can be co-administered with an oral contraceptive.

Effects of Other Drugs on entrectinib

Based on *in vitro* data, CYP3A4 is the predominant enzyme mediating the metabolism of entrectinib and formation of its major active metabolite M5.

Effect of transporters on Entrectinib disposition

Entrectinib is a weak P-gp substrate. M5 is a P-gp substrate.

Entrectinib is not a substrate of BCRP but M5 is a substrate of BCRP. Entrectinib and M5 are not substrates of OATP1B1 or OATP1B3.

9.5 Drug-Food Interactions

Entrectinib can be administered with or without food (see [10.3 Pharmacokinetics](#), Absorption.) Grapefruit or grapefruit juice with ROZLYTREK should be avoided.

9.6 Drug-Herb Interactions

St. John's Wort (*hypericum perforatum*) is a strong CYP3A inducer. Co-administration of St. John's Wort with ROZLYTREK should be avoided (see [9.4 Drug-Drug Interactions](#)).

9.7 Drug-Laboratory Test Interactions

Interactions with laboratory tests have not been established.

10 Clinical Pharmacology

10.1 Mechanism of Action

Entrectinib is a potent inhibitor of receptor tyrosine kinases TRKA, TRKB, and TRKC (encoded by the neurotrophic tyrosine receptor kinase [NTRK] genes *NTRK1*, *NTRK2*, and *NTRK3*, respectively), proto-oncogene tyrosine-protein kinase ROS (*ROS1*; encoded by the gene

ROS1), and anaplastic lymphoma kinase (*ALK*; encoded by the gene *ALK*) with IC_{50} values ranging from 0.1 to 2 nM. Entrectinib also inhibits JAK2 with an IC_{50} value of 5.4 nM. The major active metabolite of entrectinib, M5, showed similar *in vitro* potency and activity.

Fusion proteins that include TRK, *ROS1* or *ALK* kinase domains drive tumorigenic potential through hyperactivation of downstream signaling pathways leading to unconstrained cell proliferation. Entrectinib potently inhibits the TRK kinases, *ROS1*, and *ALK*, leading to inhibition of downstream signaling pathways, cell proliferation and induction of tumour cell apoptosis. Entrectinib demonstrates potent inhibition of cancer cell lines derived from multiple tumour types harboring *NTRK*, *ROS1*, and *ALK* fusion genes. Entrectinib has anti-tumour potency in *NTRK* and *ROS1* fusion-driven tumour models, driving tumour regressions across cell-line and patient-derived xenograft models.

It has demonstrated potent anti-tumour activity in three *NTRK1*-driven intracranial tumour models, including two high grade glioma mouse models. These data are consistent with entrectinib dosing resulting in sufficient brain exposure achieving target pharmacological activities at steady-state and at clinically relevant systemic exposures.

Prior treatments with other drugs that inhibit the same kinases may confer resistance to entrectinib. Point mutations in the *NTRK1* (G595R, G667C) and *NTRK3* (G623R, G623E and G623K) kinase domains have been identified with clinically acquired resistance to entrectinib.

10.2 Pharmacodynamics

Cardiac Electrophysiology

An ECG sub-study was conducted in patients who received ROZLYTREK 600 mg once daily. Entrectinib exposure-dependent trends in change from baseline in QTcF were not apparent in the analysis of ECG data, which included 107 patients with concentrations at dates/times matching the QT assessment.

10.3 Pharmacokinetics

The pharmacokinetic parameters for entrectinib and its major active metabolite (M5) have been characterized in patients with locally advanced/metastatic tumours, including patients with *NTRK*-positive solid tumours and *ROS1*-positive NSCLC from study STARTRK-1 (see Table 7).

Table 7 Summary of Entrectinib and Metabolite M5 Pharmacokinetic Parameters in Patients with Locally Advanced/metastatic Tumours

Parameter	Entrectinib Mean* (% CV)	M5 Mean* (% CV)
AUC _{D1} (nM*h)	31800 (48%)	10200 (82%)
AUC _{SS} (nM*h)	48000 (77%)	24000 (97%)
C _{maxD1} (nM)	2250 (58%)	622 (79%)
C _{maxss} (nM)	3130 (80%)	1250 (90%)
R _{acc} (AUC)	1.55 (49%)	2.84 (93%)
*Geometric mean		

Absorption: Following a single 600 mg oral administration of ROZLYTREK to patients with locally advanced or metastatic cancer, entrectinib was rapidly absorbed reaching time-to-maximum plasma concentration (T_{max}) after approximately 4 - 6 hours. Based on population pharmacokinetic analysis, steady-state was achieved within 5 days for entrectinib with 600 mg once daily dosing.

The estimated absolute bioavailability of entrectinib based on physiologically based pharmacokinetic (PBPK) modeling was 55%.

Co-administration of a high-fat (approximately 50% of total caloric content), high-calorie (approximately 800 to 1000 calories) meal with a single dose of entrectinib in healthy, adult volunteers delayed T_{max} by approximately 2 hours without significantly altering C_{max} . There was no significant impact of a high-fat, high-calorie meal on entrectinib exposure (AUC) when compared to administrations under fasting conditions. Entrectinib can may be administered with or without food (see [4 Dosage and Administration](#)).

Distribution: Entrectinib and its major active metabolite M5 are highly bound to human plasma proteins independent of drug concentrations. In human plasma, entrectinib and M5 had similar protein binding with >99% bound *in vitro*.

After a single oral dose of [^{14}C]-labeled entrectinib, the geometric mean volume of distribution (V_z/F) was 860 L, suggesting extensive distribution into tissues. Population pharmacokinetic analysis estimated volume of distribution of 551 L and 81.1 L for entrectinib and M5, respectively.

Entrectinib is a CNS penetrant molecule that showed brain-to-plasma concentration ratios of 0.4-2.2 in multiple animal species (mice, rats, and dogs).

Metabolism: Entrectinib is metabolized predominantly by CYP3A4 (~76%). Minor contributions from several other CYPs and UGT1A4 were estimated at <25% in total. The active metabolite M5 (formed by CYP3A4) and the direct N-glucuronide conjugate, M11 (formed by UGT1A4), are the two major circulating metabolites identified.

Elimination: Following administration of a single dose of [^{14}C]-labeled entrectinib administered orally to healthy subjects, the majority of radioactivity was excreted in feces (82.9%) with minimal excretion in urine (3.06%). In feces, 35.7% and 22.1% of the dose was excreted as unchanged entrectinib and M5, respectively, indicating hepatic clearance is the major route of elimination.

Entrectinib and M5 account for approximately 73% of radioactivity in systemic circulation at C_{max} , and approximately half of total radioactivity AUC_{INF} .

Population PK analysis estimated a CL/F of 19.6 L/h and 52.4 L/h for entrectinib and M5, respectively. The elimination half-lives of entrectinib and M5 were estimated to be 20 and 40 hours, respectively.

Special Populations and Conditions

Pediatrics: Non-compartmental analysis and population pharmacokinetic modeling approaches suggested that the pharmacokinetics of entrectinib and M5 were comparable in adults and children allowing extrapolation of data in adults to pediatric patients.

Data obtained from population pharmacokinetic analyses suggest that a dose of 300 mg/m² of ROZLYTREK once daily in pediatric patients results in a similar systemic exposure attained in adults treated with 600 mg of ROZLYTREK, once daily. Population pharmacokinetic analysis data support dosing of pediatric patients with BSA ≥ 1.51 m² with 600 mg of ROZLYTREK once daily. A pediatric indication has not been granted by Health Canada for ROZLYTREK.

Geriatrics: No differences in entrectinib exposure were noted in patients older than 65 years and younger adults based on pharmacokinetic analysis.

Ethnic origin: Following a single oral dose of ROZLYTREK in Japanese and Caucasian healthy volunteers, no clinically relevant differences in the exposure of ROZLYTREK were observed. Based on population pharmacokinetics analysis, there was no relationship between systemic exposure of entrectinib and race/ethnicity (Asian, Japanese, white and other ethnicities). No dose adjustment is required for patients of different race/ethnicities (see [4 Dosage and Administration](#)).

Hepatic Insufficiency: The pharmacokinetics of entrectinib were studied in subjects with mild (Child-Pugh A), moderate (Child-Pugh B) and severe (Child-Pugh C) hepatic impairment and subjects with normal hepatic function. Following administration of a single oral dose of 100 mg entrectinib, the combined AUC_{last} of entrectinib and M5 showed no relevant change in the hepatic impaired groups compared to the normal hepatic function group. The AUC_{last} geometric mean ratio (90%CI) were 1.30 (0.889, 1.89) for the mild, 1.24 (0.886, 1.73) for the moderate, and 1.39 (0.988, 1.95) for the severe hepatic impaired groups compared to the normal hepatic function group. For the unbound entrectinib and M5, the AUC_{last(fu)} geometric mean ratio (90% CI) was 1.91 (1.21, 3.02) for the mild, 1.57 (1.06, 2.31) for the moderate, and 2.34 (1.57, 3.48) for the severe hepatic impaired groups compared to the normal hepatic function group. Although the effect of hepatic impairment on unbound PK parameters generally followed a similar direction as total PK parameters, due to the high non-specific binding in buffer and high variability, results should be interpreted with caution.

In addition to the increases in entrectinib exposure observed, the variability in systemic exposure was high and observed exposures overlapped across all the study groups. No dose adjustment is required in patients with underlying mild, moderate or severe hepatic impairment. Patients with severe hepatic impairment should be carefully monitored for hepatic function and adverse reactions.

Renal Insufficiency: Negligible amounts of entrectinib and the active metabolite M5 are excreted unchanged in urine (~3 % of the dose) indicating renal clearance plays a minor role in the elimination of entrectinib. Population pharmacokinetic data obtained in patients with mild and moderate impairment show that pharmacokinetics of entrectinib are not significantly affected in renal impairment. No formal pharmacokinetic study has been conducted and no population pharmacokinetic data was collected in patients with severe renal impairment.

Published Reports

Published reports of individuals with congenital mutations in TRK pathway proteins suggest that decreases in TRK-mediated signaling are correlated with obesity, developmental delays, cognitive impairment, insensitivity to pain, and anhidrosis.

11 Storage, Stability, and Disposal

Store at room temperature (15-30°C).

Store in the original package and keep the bottle tightly closed to protect from moisture.

This medicine should not be used after the expiry date (EXP) shown on the pack.

12 Special Handling Instructions

Disposal of Unused/Expired Medicines

The release of pharmaceuticals in the environment should be minimized. Medicines should not be disposed of via wastewater and disposal through household waste should be avoided.

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

Part 2: Scientific Information

13 Pharmaceutical Information

Drug Substance

Proper/Common name: entrectinib

Chemical name: N-{5-[(3,5-difluorophenyl)methyl]-1H-indazol-3-yl}-4-(4-methylpiperazin-1-yl)-2-[(oxan-4-yl)amino]benzamide

Molecular formula and molecular mass: C₃₁H₃₄F₂N₆O₂, 560.64 g/mol

Structural formula:

Physicochemical properties: Entrectinib is a white to off-white or pale pink powder or powder with lumps. The solubility of entrectinib in aqueous media has a pronounced dependence on the pH value. At high pH values, entrectinib has a solubility of about 0.004 mg/mL. With decreasing pH values (pH = 1.2), the solubility increases up to > 40 mg/mL. Entrectinib is defined as poorly soluble, as the highest dose strength (200 mg) is not soluble in less than 250 mL water over the entire pH range of 1.2-6.8.

14 Clinical Trials

14.1 Clinical Trials by Indication

NOC/c **NTRK gene fusion positive solid tumours**

Table 8 - Summary of patient demographics for clinical trials in NTRK gene fusion positive solid tumours (NTRK Efficacy Evaluable Population)

Study #	Study design	Dosage, route of administration and duration	Study subjects (n)	Mean age (Range)	Sex
ALKA-372-001	Phase I, first-in-human, multicenter, single-arm, open-label, ascending-dose study with dose escalation according to a standard 3+3 scheme.	<u>Schedule A:</u> 100, 200, 400, 800, 1200, or 1600 mg/m ² , orally, once daily (fasted) 4-days on, 3- days off schedule x 3 weeks followed by 7- day rest in a 4-week cycle <u>Schedule B:</u> 200, 400 mg/m ² or 600 mg, orally, continuous once daily (fed) in a 4-week cycle. <u>Schedule C:</u> 400 or 800mg/m ² , orally, once daily (fed) in a continuous 4-days on, 3-days off schedule in a 4-week cycle	1	75 years (75 to 75 years)	F: 1 M: 0
RXDX-101-01 (STARTRK-1)	Phase I, multi-center, single-arm, open label, ascending-dose study with dose escalation according to a standard 3+3 scheme.	100, 200, 400 mg/m ² or 600, 800 mg, orally, continuous once daily (fed) in 4-week cycles	2	44 years (42 to 46 years)	F: 1 M: 1
RXDX-101-02 (STARTRK-2)	Phase II, multicenter, international single-arm open-label, basket study.	600 mg, orally, once daily in 4-week cycles.	51	57 years (21 to 83 years)	F: 30 M: 21

Three open-label clinical trials in patients with advanced cancer contributed to a pre-specified integrated efficacy analysis evaluating ROZLYTREK in the treatment of extracranial *NTRK* fusion-positive solid tumours in adult patients ≥ 18 years of age (ALKA, n=1; STARTRK-1, n=2; and STARTRK-2, n=51).

Study ALKA was a Phase I single arm, open-label study in adult patients with solid tumours with *NTRK1/2/3*, *ROS1*, or *ALK* molecular alterations to determine the maximum tolerated dose. Study STARTRK-1 was a Phase I multi-center single arm, open label study in adult patients with solid tumours with *NTRK1/2/3*, *ROS1*, or *ALK* molecular alterations. The study included a dose escalation segment and a dose expansion segment. In the dose expansion segment, patients received 600 mg daily in repeated 4-week cycles and the primary objective was to evaluate the recommended Phase II dose. Study STARTRK-2 is an ongoing multicenter, international Phase

II single-arm basket study in adult patients with solid tumours with *NTRK1/2/3*, *ROS1*, or *ALK* gene rearrangements. Patients received 600 mg ROZLYTREK once daily in 4-week cycles.

The primary efficacy outcome measures in the integrated analyses were objective response rate (ORR) and duration of response (DOR) as evaluated by Blinded Independent Central Review (BICR) according to Response Evaluation Criteria in Solid Tumours (RECIST) v1.1. Secondary efficacy outcome measures included intracranial (IC) ORR and IC-DOR (also evaluated by BICR using RECIST v1.1) in patients presenting with measurable CNS metastases at baseline.

The efficacy evaluable analysis set comprised a total of 54 adult patients with confirmed *NTRK* fusion-positive extracranial solid tumours treated with ROZLYTREK, not previously treated with a TRK inhibitor, presenting with measurable disease at baseline as assessed by investigator, and with ≥ 6 months of follow up. *NTRK* fusion-positive status was determined by a validated nucleic acid-based test performed at a Clinical Laboratory Improvement Amendments (CLIA)-certified or equivalently accredited laboratory, prior to enrollment in the study. A total of 52 (96%) patients had an *NTRK* gene fusion detected by NGS and 2 (4%) had an *NTRK* gene fusion detected by other nucleic acid-based tests. Eighty-three percent of patients had central laboratory confirmation of *NTRK* gene fusion using an analytically validated NGS test.

The baseline demographic and disease characteristics of the efficacy evaluable population were: 41% males, median age of 57 years (range: 21 to 83 years), 80% white, 13% Asian, and 57% never smoked. The ECOG (Eastern Cooperative Oncology Group) performance status at baseline was 0 (43%), 1 (46%), or 2 (11%). Most patients (96%) had metastatic disease [most common sites being lung (61%), lymph nodes (56%), and brain (22%)], 4% patients had locally advanced disease, and 26% patients had no prior systemic therapies. The overall median duration of follow-up was 13 months.

Efficacy in Adult Patients

Efficacy results from patients with *NTRK* fusion-positive solid tumours are summarized in Table 9.

Table 9 Overall Efficacy by BICR in Adults with *NTRK* Fusion-Positive Solid Tumours

Efficacy Endpoints	ROZLYTREK N=54
Primary endpoints (BICR-assessed, RECIST 1.1)

Confidence Intervals (CI) are calculated using the Clopper-Pearson method.				

Intracranial Response

Of the 54 adult patients with *NTRK* fusion-positive solid tumours in the efficacy evaluable analysis set, 11 patients had CNS metastases at baseline as assessed by BICR, including 7 patients with measurable CNS lesions. Intracranial ORR and DOR (assessed by BICR according to RECIST version 1.1) in this subgroup of patients with measurable CNS lesions at baseline are summarized in Table 12.

Table 12 Intracranial Efficacy in Adults with *NTRK* Fusion-Positive Solid Tumours with CNS Metastases at Baseline by BICR

Secondary Endpoint (BICR-assessed, RECIST 1.1)	CNS Metastases at Baseline (by BICR)
	Measurable disease N=7
IC-ORR	
Responders	4
IC-ORR% (95% CI) ¹	57% (18, 90)
Complete Response n (%)	1 (14%)
Partial Response n (%)	3 (43%)
IC-DOR	
Number of patients with events (%)	1 (25%)
Median, months (95%) ²	NE (5, NE)

NE: not estimable.

IC-ORR derived using RECIST 1.1 criteria applied only to CNS lesions.

¹Confidence Intervals (CI) calculated using the Clopper-Pearson method.

²Median based on Kaplan-Meier estimates. 95% CI for median was computed using the method of Brookmeyer and Crowley.

Patient Reported Outcomes

Study STARTRK-2 evaluated patient-reported outcomes (PROs) of the treatment impact on functioning and health-related quality of life (HRQoL) based on the EORTC Core Quality of Life Questionnaire (QLQ-C30). A change from baseline of ≥ 10 points on a 1-100 scale was considered clinically meaningful, with higher scores reflecting better functioning and HRQoL. Cycle 10 was selected as the last time-point providing representative information considering that by then less than 50% of the PRO evaluable population was still in the study.

At baseline, patients reported moderate to high baseline values on HRQoL and functioning scales (Global health status: 70; Role functioning: 67; Physical functioning: 74; Cognitive functioning: 85). Throughout the study (Cycle 2-Cycle 10), 20 to 31% of patients reported clinically meaningful improvement of global health status (QoL), while 25 to 41% reported clinically meaningful worsening. Across the functioning scales, 19 to 48% of patients reported clinically meaningful improvement in role and physical functioning, while 33 to 46% reported clinically meaningful worsening in cognitive functioning.

ROS1 Positive Non-Small Cell Lung Cancer (NSCLC)

Table 13 Summary of patient demographics for clinical trials in ROS1 positive NSCLC (ROS1 positive NSCLC Efficacy Evaluable Population)

Study #	Study design	Dosage, route of administration and duration	Study subjects (n)	Mean age (Range)	Sex
ALKA-372-001 (ALKA)	Phase I, first-in-human, multicenter, single-arm, open-label, ascending-dose study with dose escalation according to a standard 3+3 scheme.	<u>Schedule A:</u> 100, 200, 400, 800, 1200, or 1600 mg/m ² , orally, once daily (fasted) 4-days on, 3- days off schedule x 3 weeks followed by 7- day rest in a 4-week cycle <u>Schedule B:</u> 200, 400 mg/m ² or 600 mg, orally, continuous once daily (fed) in a 4-week cycle. <u>Schedule C:</u> 400 or 800mg/m ² , orally, once daily (fed) in a continuous 4-days on, 3-days off schedule in a 4-week cycle	9	53 years (27 to 67 years)	F: 7 M: 2
RXDX-101-01 (STARTRK-1)	Phase I, multi-center, single-arm, open-label, ascending-dose study with dose escalation according to a standard 3+3 scheme.	100, 200, 400 mg/m ² or 600, 800 mg, orally, continuous once daily (fed) in 4-week cycles	7	55 years (40 to 69 years)	F: 4 M: 3
RXDX-101-02 (STARTRK-2)	Phase II, multicenter, international single-arm open-label, basket study.	600 mg, orally, once daily in 4-week cycles.	78	53 years (28 to 86 years)	F: 49 M: 29

The efficacy of ROZLYTREK was evaluated in a pooled subgroup of patients with ROS1-positive metastatic NSCLC who received ROZLYTREK 600 mg orally once daily in three single-arm, open-label clinical trials: ALKA, STARTRK-1 and STARTRK-2. To be included in this pooled subgroup, patients were required to have histologically confirmed, recurrent or metastatic, ROS1-positive NSCLC, ECOG performance status ≤ 2, measurable disease per RECIST v 1.1, and no prior therapy with a ROS1 inhibitor. ROS1-positive status was

determined by a validated nucleic acid-based test performed at a CLIA-certified or equivalently accredited laboratory, prior to enrollment in the study.

All patients were assessed for CNS lesions at baseline. The major efficacy outcome measures were overall response rate (ORR) and duration of response (DOR) according to RECIST v1.1 as assessed by blinded independent central review (BICR). Intracranial response according to RECIST v1.1 was assessed by BICR. Tumor assessments with imaging were performed every 8 weeks.

The integrated efficacy analyses set comprised of 94 patients with ROS1-positive NSCLC not previously treated with crizotinib. The baseline demographic and disease characteristics of the efficacy evaluable population were: Female (64%), Male (36%), median age of 53 years (range: 27 to 86 years), White (49%), Asian (44%), Black (5%); never smoked (60%); and ECOG performance status 0 or 1 (88%). All but one patients (99%) had metastatic disease, with 43% having brain metastases. Most common metastatic sites included lymph nodes (76%), lung (57%), bone (39%) and liver (19%). Majority of patients (76%) received prior systemic therapy including chemotherapy, immunotherapy, targeted therapy or hormonal therapy. Half (50%) of patients had prior surgery and 40% had prior radiotherapy.

Efficacy results from 94 patients with ROS1-positive NSCLC patients are summarized in Table 14. Among 94 patients, 88 (94%) patients received the recommended entrectinib dose 600 mg daily. The median duration of treatment was 13.7 months (range: 0.1 month to 42 months). The median time to response was 1 month (range: 0.7 month to 17.4 months.)

Table 14 Efficacy Results in Patients with ROS1-Positive NSCLC per BICR Assessment

Efficacy Endpoints	ROZLYTREK N=94
<i>Overall Response Rate (ORR)</i>	
ORR (95% CI)	73.4 (63.3, 82.0)
Complete Response	11 (11.7%)
Partial Response	58 (61.7%)
<i>Duration of Response (DOR)</i>	
Time to Event, Median (months)	15.3
Range (months)	1.8, 36.8
%DOR ≥ 6 months	80%
% DOR ≥ 9 months	77%
% DOR ≥ 12 months	63%
% DOR ≥ 18 months	47%
<i>Progression-Free Survival (PFS)</i>	
Patients with event, n	50 (53.2%)
Median, months (95% CI)	15.7 (11.9, 26.3)

Overall survival data were not mature at the time of the data cut-off.

Intracranial Efficacy

Among the 34 patients with measurable and non-measurable brain metastases at baseline, the intracranial response rate was 50.0% (95% CI: 32.4, 67.6) with 5 (14.7%) patients achieving a complete response and 12 (35.3%) patients achieving a partial response. Median intracranial DOR based on the BICR assessment was 12.9 months (95% CI: 5.6, NE).

Shown in Figure 2 is the best percentage change from baseline (BICR assessed) in the sum of longest diameters of target CNS lesions in ROS1-positive NSCLC patients with measurable CNS disease at baseline by BICR.

Figure 2 Best Percentage Change in the Sum of Measurable CNS Metastases from Baseline (BICR Assessment) in Adults with ROS1-Positive NSCLC

SLD: Sum of Longest Diameter

Patients without measurable CNS disease at baseline or without post-baseline measurements were excluded from the plot

Patient Reported Outcomes

Patients with ROS1-positive NSCLC reported rapid and durable clinically meaningful improvement (change from baseline of ≥ 10 points on a 1-100 scale) in lung-cancer symptoms (cough, dyspnea, chest pain) as measured by the EORTC QLQ LC13. Patients maintained their day-to-day function resulting in an improvement in HRQoL while on ROZLYTREK treatment (evaluated by the Physical function, Role function and Global Health Status from the EORTC QLQ-C30). In addition, most patients, indicated that the symptoms commonly associated with ROZLYTREK treatment (lack of appetite, nausea, diarrhea and vomiting) were of low severity, if present.

15 Microbiology

Not applicable.

16 Non-Clinical Toxicology

General Toxicity

Entrectinib-related toxicities in repeat dose studies of up to 13-weeks with daily oral gavage administration in adult rats and dogs, and juvenile rats were observed in the CNS (convulsions, abnormal gait, tremors) at ≥ 0.2 times the human exposures by C_{max} at the recommended dose, skin (scabs/sores) and decreased RBC parameters at ≥ 0.1 times the human exposure by AUC at the recommended dose. In adult rats and dogs, effects on liver (increased ALT and hepatocellular necrosis) were observed at ≥ 0.8 times the human exposure by AUC at the recommended dose. In dogs, diarrhea at ≥ 0.1 times the human exposure by AUC at the recommended dose was also observed.

Carcinogenicity

No carcinogenicity studies have been performed to establish the carcinogenic potential of entrectinib.

Genotoxicity

Entrectinib was not mutagenic in vitro in the bacterial reverse mutation (Ames) assay. Entrectinib was not clastogenic in the in vivo micronucleus assay in rats and did not induce DNA-damage in a comet assay in rats. A potential for abnormal chromosome segregation (aneugenicity) has been detected under *in vitro* conditions in cultured human peripheral blood lymphocytes (HPBL) but was not detected in the *in vivo* micronucleus assay in rats.

Reproductive Toxicity

In an embryo-fetal developmental study in rats, maternal toxicity (decreased body weight gain and food consumption) and fetal malformations (including body closure defects and malformations of the vertebrae, limbs, and ribs), were observed at 200 mg/kg/day of entrectinib, which represents approximately 2.7-fold the human exposure by AUC at the recommended dose. Lower fetal weights and reduced skeletal ossification were observed at doses ≥ 12.5 and 50 mg/kg, approximately ≥ 0.2 and ≥ 0.9 times the human exposure by AUC (48 $\mu\text{M}\cdot\text{h}$) at the recommended dose, respectively.

Impairment of Fertility

Dedicated fertility studies were not conducted with entrectinib. With the exception of dose-dependent decreases in prostate weight in male dogs, there were no effects on male and female reproductive organs observed in general toxicology studies conducted in rats and dogs by daily oral gavage administration, at doses resulting in exposures of up to approximately 3.2-fold the human exposure (AUC) at the 600 mg dose.

Juvenile Toxicity

In a 13-week juvenile rat toxicology study, animals were dosed daily by oral gavage from post-natal day 7 to day 97 (approximately equivalent to neonate to adulthood). Entrectinib was dosed at 4, 8 or 16 mg/kg/day approximately 0.06, 0.14 and 0.18 times the human exposures by AUC at the 600 mg dose. Entrectinib related mortality was observed at 16 mg/kg/day. CNS related toxicity signs included non-sustained convulsions at ≥ 8 mg/kg/day, and abnormal gait, decreased activity and tremors at 16 mg/kg/day. Additional entrectinib-related clinical signs included eyes partly closed, erected fur, dehydration, skin scabs, fur loss or thin fur, and fur

staining at all dose levels and hunched posture, pale skin, labored breathing, prostration, low carriage, and increased breathing rate at 16 mg/kg/day. Effects on growth and development were observed in the dosing and recovery phases including decreased body weight gain and delayed sexual maturation at ≥ 4 mg/kg/day, deficits in neurobehavioral assessments including functional observational battery (decreased landing foot splay, grip strength) and learning and memory at ≥ 8 mg/kg/day, and decreased femur length at 16 mg/kg/day.

Safety Pharmacology

In dogs, daily oral gavage administration of entrectinib caused prolongation of QT/QTc interval at ≥ 0.1 times the human exposure by $C_{\max}$ at the recommended dose. In an *in vitro* hERG assay in stably transfected HEK293 cells under patch clamp conditions, IKr channel inhibition was observed with an $IC_{50}=0.6$ μ M.

Patient Medication Information

READ THIS FOR SAFE AND EFFECTIVE USE OF YOUR MEDICINE

Pr **ROZLYTREK®** **entrectinib capsules**

This Patient Medication Information is written for the person who will be taking **ROZLYTREK**. This may be you or a person you are caring for. Read this information carefully. Keep it as you may need to read it again.

This Patient Medication Information is a summary. It will not tell you everything about this medication. If you have more questions about this medication or want more information about **ROZLYTREK**, talk to a healthcare professional.

Serious warnings and precautions box

- ROZLYTREK may harm your unborn baby.
- ROZLYTREK may cause congestive heart failure. This occurs when your heart muscle does not pump blood as well as it should.

What is ROZLYTREK is used for:

For the following indication ROZLYTREK has been approved **with conditions (NOC/c)**. This means it has passed Health Canada's review and can be bought and sold in Canada, but the manufacturer has agreed to complete studies to make sure the drug works the way it should. For more information, talk to your healthcare professional.

Solid Tumours

ROZLYTREK is used to treat adults with solid tumours that have a Neurotrophic Tyrosine Receptor Kinase (*NTRK*) gene fusion without a known resistance mutation. ROZLYTREK can treat cancers that have spread to different parts of the body. It is for patients without other treatment options.

To benefit from ROZLYTREK, the patient must have a tumour that has an *NTRK* gene fusion. This can be checked by a test that is done before you start ROZLYTREK.

For the following indication ROZLYTREK has been approved **without conditions**. This means it has passed Health Canada's review and can be bought and sold in Canada.

Lung Cancer

ROZLYTREK is used to treat adults with a kind of lung cancer called non-small cell lung cancer (NSCLC). The non-small cell lung cancer:

- is "ROS1-positive" (this means that your cancer cells have a fault in a gene called 'ROS1'), and
- may have spread to other parts of your body, and
- has not been treated with another drug called crizotinib.

To benefit from ROZLYTREK, the patient must have non-small cell lung cancer (NSCLC) that is ROS1-positive. This can be checked by a test that is done before you start ROZLYTREK.

What is a Notice of Compliance with Conditions (NOC/c)?

A Notice of Compliance with Conditions (NOC/c) is a type of approval to sell a drug in Canada.

Health Canada only gives a NOC/c to a drug that treats, prevents, or helps identify a serious or life-threatening illness. The drug must show promising proof that it works well, is of high quality, and is reasonably safe. Also, the drug must either respond to a serious medical need in Canada, or be much safer than existing treatments.

Drug makers must agree in writing to clearly state on the label that the drug was given a NOC/c, to complete more testing to make sure the drug works the way it should, to actively monitor the drug's performance after it has been sold, and to report their findings to Health Canada.

How ROZLYTREK works:

ROZLYTREK works by blocking the action of enzymes which have a fault in them. This fault is in the *NTRK* genes that make the enzymes. The faulty enzymes encourage the cancer cells to grow. ROZLYTREK may slow down or stop the cancer from growing. It may also help to shrink your cancer.

The ingredients in ROZLYTREK are:

Medicinal ingredient: entrectinib

Non-medicinal ingredients: Colloidal silicon dioxide, crospovidone, FD&C blue #2 aluminum lake, hypromellose, lactose anhydrous, magnesium stearate, microcrystalline cellulose, propylene glycol, shellac, strong ammonia solution, tartaric acid, titanium dioxide.

Capsules also contain:

- 100 mg: yellow iron oxide
- 200 mg: FD&C yellow #6

ROZLYTREK comes in the following dosage forms:

Capsule: 100 mg and 200 mg

Do not use ROZLYTREK if:

- You are allergic to any ingredients in this drug or the bottle.

To help avoid side effects and ensure proper use, talk to your healthcare professional before you take ROZLYTREK. Talk about any health conditions or problems you may have, including if you:

- Have or had any heart problems such as:
 - Congestive heart failure (your heart does not pump blood as well as it should).
 - Long QT syndrome. This is a heart rhythm condition. ROZLYTREK and certain other drugs can cause heart rhythm problems. Avoid taking these other drugs with ROZLYTREK. Taking these drugs together with ROZLYTREK might make your heart rhythm problems worse.
- Have excess uric acid in your blood.

- Have liver or kidney problems.
- Have bone fractures.
- Have nervous system or cognitive problems.
- Have problems like fainting or passing out.
- Have or have had eye or vision problems.

Other warnings you should know about:

- Only a healthcare professional who has experience treating cancer should treat you with this drug.

Female Patients:

- Avoid becoming pregnant while taking ROZLYTREK. It may harm your unborn baby.
- Use highly effective birth control if you can get pregnant while taking ROZLYTREK and for 5 weeks after your last dose.
- Tell your healthcare professional right away if you become pregnant or think you are pregnant during treatment with ROZLYTREK.
- You should not be pregnant at the beginning of treatment with ROZLYTREK. Your healthcare professional should do a pregnancy test before you start ROZLYTREK.
- It is not known if ROZLYTREK passes into breast milk. Do not breastfeed during treatment with ROZLYTREK and for 14 days after the final dose. Talk to your healthcare professional about the best way to feed your baby during this time.

Male Patients:

- Use highly effective birth control if your partner can get pregnant while you are on ROZLYTREK and for 3 months after your last dose.

Children less than 18 years of age:

- ROZLYTREK is not recommended for use in children less than 18 years of age. There is a higher risk of bone fractures in children compared to adults when using ROZLYTREK.

Driving and using machines:

- Before you do tasks which require attention wait until you know how you respond to ROZLYTREK. It can cause you to feel faint, dizzy, or tired. It can give you blurred vision, mental status changes, confusion, and hallucinations. Do not drive or operate machines until you feel well.

Tell your healthcare professional about all the medicines you take, including any drugs, vitamins, minerals, natural supplements or alternative medicines.

The following may interact with ROZLYTREK:

- Telithromycin – used to treat certain types of bacterial infection
- St. John's Wort (*hypericum perforatum*) – a herbal medicine, used to treat depression
- Ritonavir, saquinavir - used to treat AIDS/HIV infection
- Itraconazole, ketoconazole, posaconazole and voriconazole - used to treat fungal and bacterial infections
- Phenytoin, carbamazepine, phenobarbital - used to treat seizures
- Rifampin, rifabutin – used to treat lung disease
- Grapefruit and grapefruit juice

How to take ROZLYTREK:

- Take exactly as prescribed for you by your healthcare provider. Continue to take ROZLYTREK unless your healthcare provider tells you to stop. Treatment may continue until the cancer gets worse or you get side effects that could prevent treatment continuation.
- Take with or without food.
- Swallow whole. Do not open or dissolve the capsules.
- If you vomit right after taking a dose, you may take the dose again.

Recommended dose:**Adults**

- Recommended Dose: 600 mg once a day.
- Your healthcare professional will monitor your health. Your healthcare professional may interrupt, reduce, or stop your dose. This may occur based on your current health, if you take certain other medications, if your disease gets worse, or if you have too many side effects.

Overdose:

If you think you, or a person you are caring for, have taken too much ROZLYTREK, contact a healthcare professional, hospital emergency department, regional poison control centre or Health Canada's toll-free number, 1-844 POISON-X (1-844-764-7669) immediately, even if there are no symptoms.

Missed Dose:

- If you are less than 12 hours late, take the missed dose as soon as you remember. Take the next dose at your regular time.
- If you are more than 12 hours late, do NOT take the missed dose. Wait until the regular time for your next dose.
- Do not take a double dose to make up for a missed dose.

Possible side effects from using ROZLYTREK:

These are not all the possible side effects you may feel when taking ROZLYTREK. If you experience any side effects not listed here, contact your healthcare professional.

The most common side effects of ROZLYTREK include:

- tiredness, difficulty sleeping
- constipation, diarrhea, nausea, vomiting, abdominal pain
- change in sense of taste and touch
- swelling
- dizziness, headaches
- abnormal touch sensation (tingling, pain or numbness in hands, fingers and toes)
- pain in joints, bones, muscles or nerves
- weakness of muscles
- weight gain, loss of appetite, difficulty swallowing
- cough
- fever
- rash

ROZLYTREK can cause abnormal exam and blood test results. Your healthcare professional will do some tests before and during your treatment to monitor your health. These include checking for heart and liver problems. Your healthcare professional will interpret the results. They will tell you if there are any abnormalities in your tests that might need treatment.

Serious side effects and what to do about them

Frequency/Side Effect/Symptom	Talk to your healthcare professional		Stop taking this drug and get immediate medical help
	Only if severe	In all cases	
Very common			
Anemia (reduction in the number of red blood cells): Feel tired, looking pale and you may feel your heart pumping		✓	
Decreased Neutrophils (a kind of white blood cells): Fever, fatigue, mouth ulcer, sore throat, or infections.		✓	
Dehydration (when there is not enough water in the body): Thirst, reduced sweating and urine, dry mouth, dizziness	✓		
Eye problems: blurred vision, loss of vision in eye, double vision, increased sensitivity of the eyes to light, clouding of lens in eye, spots in vision that appear as specks or strings of floating material; spots that move with eye movement.		✓	
Liver Problems and increased liver enzymes: Loss of appetite, feeling sick or being sick, yellow skin, itching or pain in your liver area.		✓	
Lung problems/infections: difficult and painful breathing, shortness of breath, sore throat, cough, sinus congestion, wheezing, fever, runny or stuffy nose, chest pain when you breathe or cough, sweating and shaking chills		✓	
Nervous System / Cognitive Disorders: feeling confused, mental status change, anxiety, persistent sad mood, decreased attention and awareness.		✓	

Frequency/Side Effect/Symptom	Talk to your healthcare professional		Stop taking this drug and get immediate medical help
	Only if severe	In all cases	
Disorientation, agitation. Having memory problems. See or hear things that are not there (hallucinations).			
Urinary tract infection: blood in urine, pain when you go pee.		✓	
Common			
Ataxia (lack of muscle coordination): difficulty with fine motor tasks such as eating, writing or buttoning shirt; difficulty walking; loss of balance; Slurring speech.		✓	
Congestive Heart Failure (heart does not pump blood as well as it should): cough, shortness of breath, swelling in your legs, arms, ankles and feet, fluid retention, lack of appetite, rapid or irregular heart beat.			✓
Hypotension (low blood pressure): dizziness, fainting, lightheadedness.		✓	
Hyperuricemia (high levels of uric acid in the blood): severe pain in joints, joint stiffness, redness and swelling in joints.		✓	
Syncope (fainting)		✓	
Pulmonary embolism (blood clot in the lung): severe chest pain, coughing up blood, shortness of breath.			✓
Prolongation of QT interval (a heart rhythm condition): Irregular heartbeat, fainting, loss of consciousness, seizures.			✓
Urinary retention (difficulty emptying bladder)		✓	
Uncommon			
Bone fractures (broken bone): Area around break will be painful and swollen, bulge or		✓	

Frequency/Side Effect/Symptom	Talk to your healthcare professional		Stop taking this drug and get immediate medical help
	Only if severe	In all cases	
bump at site of break, broken bone may push through skin.			
Sepsis (serious infection due to bacteria in your blood): fever, shaking, chills, weakness, fast heart rate, rapid breathing.			✓
Tumour lysis syndrome (the sudden, rapid death of cancer cells due to the treatment): nausea, shortness of breath, irregular heartbeat, heart rhythm disturbances, lack of urination, clouding of urine, muscle spasms or twitching, tiredness and/or joint pain, severe muscle weakness, and seizures. Metabolic disorders (kidney failure, abnormal heartbeat) and abnormal blood tests due to rapid breakdown of cancer cells.			✓

If you have a troublesome symptom or side effect that is not listed here or becomes bad enough to interfere with your daily activities, talk to your healthcare professional.

Reporting side effects

You can report any suspected side effects associated with the use of health products to Health Canada by:

- Visiting the Web page on Adverse Reaction Reporting (canada.ca/drug-device-reporting) for information on how to report online, by mail or by fax; or
- Calling toll-free at 1-866-234-2345.

NOTE: Contact your health professional if you need information about how to manage your side effects. The Canada Vigilance Program does not provide medical advice.

Storage:

- Store ROZLYTREK at room temperature (15°C to 30°C).
- Store in the original package. Keep the bottle tightly closed to protect from moisture.
- Do not use this medicine after the expiry date (EXP) shown on the pack.
- Keep out of reach and sight of children.

If you want more information about ROZLYTREK:

- Talk to your healthcare professional
- Find the full product monograph that is prepared for healthcare professionals and includes this Patient Medication Information by visiting the Health Canada Drug Product Database website ([Drug Product Database: Access the database](https://www.hc-sc.gc.ca/drugs-drugs/index-eng.php)); the manufacturer's

website www.rochecanada.com, or by calling 1-888-762-4388.
